and treatment of diseases and clinical conditions associated with INPP5B. The function of INPP5B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM50.Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 1 (MAP3K7IP1, Accession NM_006116) is another VGAM2356 host target gene. MAP3K7IP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K7IP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K7IP1 BINDING SITE, designated SEQ ID:12761, to the nucleotide sequence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80266] Another function of VGAM2356 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 1 (MAP3K7IP1, Accession NM_006116), a gene which may be an important signaling intermediate between tgfb receptors and map3k7/tak1. Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with MAP3K7IP1. The function of MAP3K7IP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132.MCF.2 Cell Line Derived Transforming Sequence (MCF2, Accession NM_005369) is another VGAM2356 host target gene. MCF2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MCF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCF2 BINDING SITE, designated SEQ ID:11841, to the nucleotide sequence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80267] Another function of VGAM2356 is therefore inhibition of MCF.2 Cell Line Derived Transforming Sequence (MCF2, Accession NM_005369), a gene which Cytoplasmic oncoprotein similar to vimentin. Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCF2. The function of MCF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM763.Placental Growth Factor, Vascular Endothelial Growth Factor-related Protein (PGF, Accession NM_002632) is another VGAM2356 host target gene. PGF BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGF BINDING SITE, designated SEQ ID:8492, to the nucleotide sequence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80268] Another function of VGAM2356 is therefore inhibition of Placental Growth Factor, Vascular Endothelial Growth Factor-related Protein (PGF, Accession NM_002632), a gene which is a growth factor active in angiogenesis, and endothelial cell growth, stimulating cell proliferation and migration. it binds to receptor vegfr-1/fl. Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGF. The function of PGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1420.DEAD/H (Asp-Glu-Ala-Asp/His) Box

Polypeptide 17, 72kDa (DDX17, Accession NM_006386) is another VGAM2356 host target gene. DDX17 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DDX17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX17 BINDING SITE, designated SEQ ID:13090, to the nucleotide sequence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80269] Another function of VGAM2356 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 17, 72kDa (DDX17, Accession NM_006386). Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX17. FLJ00024 (Accession XM_033361) is another VGAM2356 host target gene. FLJ00024 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ00024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:31896, to the nucleotide

sequence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80270] Another function of VGAM2356 is therefore inhibition of FLJ00024 (Accession XM_033361). Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024. FLJ14871 (Accession NM_032854) is another VGAM2356 host target gene. FLJ14871 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14871 BINDING SITE, designated SEQ ID:26652, to the nucleotide sequence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80271] Another function of VGAM2356 is therefore inhibition of FLJ14871 (Accession NM_032854). Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14871. FLJ21687 (Accession NM_024859) is another VGAM2356 host target gene. FLJ21687 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ21687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21687 BINDING SITE, designated SEQ ID:24292, to the nucleotide sequence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80272] Another function of VGAM2356 is therefore inhibition of FLJ21687 (Accession NM_024859). Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21687. KIAA1196 (Accession XM_028968) is another VGAM2356 host target gene. KIAA1196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1196 BINDING SITE, designated SEQ ID:30823, to the nucleotide sequence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80273] Another function of VGAM2356 is therefore inhibition of KIAA1196 (Accession XM_028968). Accordingly, utilities

of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1196. Neuronal Pentraxin Receptor (NPTXR, Accession NM_058178) is another VGAM2356 host target gene. NPTXR BINDING SITE1 and NPTXR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NPTXR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTXR BINDING SITE1 and NPTXR BINDING SITE2, designated SEQ ID:27734 and SEQ ID:15586 respectively, to the nucleotide sequence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80274] Another function of VGAM2356 is therefore inhibition of Neuronal Pentraxin Receptor (NPTXR, Accession NM_058178). Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTXR. LOC256222 (Accession XM_173177) is another VGAM2356 host target gene. LOC256222 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256222, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256222 BINDING SITE, designated SEQ ID:46428, to the nucleotide sequence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80275] Another function of VGAM2356 is therefore inhibition of LOC256222 (Accession XM_173177). Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256222. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2357 (VGAM2357) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80276] VGAM2357 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2357 was detected is described hereinabove with reference to Figs. 1-8.

[80277] VGAM2357 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2.

VGAM2357 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80278] VGAM2357 gene encodes a VGAM2357 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2357 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2357 precursor RNA is designated SEQ ID:2343, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2343 is located at position 32894 relative to the genome of Equine Herpesvirus 2.

[80279] VGAM2357 precursor RNA folds onto itself, forming VGAM2357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80280] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2357 folded precursor RNA into VGAM2357 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2357 RNA is designated SEQ ID:5068, and is provided hereinbelow with reference to the sequence listing part.

[80281] VGAM2357 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2357 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2357 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80282] VGAM2357 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2357 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2357 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2357 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2357 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80283] The complementary binding of VGAM2357 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2357 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2357 host target RNA into VGAM2357 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80284] It is appreciated that VGAM2357 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2357 host target genes. The mRNA of each one of this plurality of VGAM2357 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2357 RNA, herein designated VGAM RNA, and which when bound by VGAM2357 RNA causes inhibition of translation of respective one or more VGAM2357 host target proteins.

[80285] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2357 gene, herein designated VGAM GENE, on one or more VGAM2357 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80286] It is yet further appreciated that a function of VGAM2357 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2357 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2357 correlate with, and may be deduced from, the identity of the host target genes which VGAM2357 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80287] Nucleotide sequences of the VGAM2357 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2357 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2357 are further described hereinbelow with reference to Table 1.

[80288] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2357 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2357 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80289] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2357 gene, herein designated VGAM is inhibition of expression of VGAM2357 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2357 correlate with, and may be deduced from, the identity of the target genes which VGAM2357 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80290] ATP-binding Cassette, Sub-family E (OABP), Member 1 (ABCE1, Accession XM_003555) is a VGAM2357 host target gene. ABCE1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCE1 BINDING SITE, designated SEQ

ID:29939, to the nucleotide sequence of VGAM2357 RNA, herein designated VGAM RNA, also designated SEQ ID:5068.

[80291] A function of VGAM2357 is therefore inhibition of ATP-binding Cassette, Sub-family E (OABP), Member 1 (ABCE1, Accession XM_003555), a gene which a Ribonuclease L inhibitor. Accordingly, utilities of VGAM2357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCE1. The function of ABCE1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1924.Procollagen-lysine, 2-oxoglutarate 5-dioxygenase (lysine hydroxylase) 2 (PLOD2, Accession NM_000935) is another VGAM2357 host target gene. PLOD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLOD2 BINDING SITE, designated SEQ ID:6640, to the nucleotide sequence of VGAM2357 RNA, herein designated VGAM RNA, also designated SEQ

ID:5068.

[80292] Another function of VGAM2357 is therefore inhibition of Procollagen-lysine, 2-oxoglutarate 5-dioxygenase (lysine hydroxylase) 2 (PLOD2, Accession NM_000935), a gene which catalyzes the formation of hydroxylysine in collagens. Accordingly, utilities of VGAM2357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLOD2. The function of PLOD2 has been established by previous studies. Lysyl hydroxylase (EC 1.14.11.4) catalyzes the hydroxylation of lysyl residues in collagens. The active enzyme is a homodimer consisting of subunits with a molecular weight of about 85,000. Valtavaara et al. (1997) reported the isolation and characterization of cDNA clones for a novel isoform, which they called lysyl hydroxylase-2, symbolized PLOD2. The predicted 737-amino acid polypeptide includes an N-terminal signal peptide and has overall similarity of more than 75% to lysyl hydroxylase-1, or PLOD, from human and chicken. The similarity is even higher in the C-terminal region of the polypeptides. The PLOD2 gene contains 9 cysteines conserved in PLOD, in addition to conserved histidines in the putative active site. By Northern analysis, Valtavaara et al. (1997) detected a 4.2-kb tran-

script that was highly expressed in pancreas, skeletal muscle, heart, and placenta. Recombinant protein produced from cDNA using a baculovirus expression system yielded enzyme with lysyl hydroxylase activity in vitro. Animal model experiments lend further support to the function of PLOD2. Szpirer et al. (1997) mapped the PLOD2 gene to human chromosome 3 by somatic cell hybrid analysis and to 3q23-q24 by fluorescence in situ hybridization. The rat gene was mapped to chromosome 8 where the genes shared by human chromosome 3 are located. Sipila et al. (2000) mapped the mouse homolog to chromosome 9.

[80293] It is appreciated that the abovementioned animal model for PLOD2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[80294] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[80295] Valtavaara, M.; Papponen, H.; Pirttila, A.-M.; Hiltunen, K.; Helander, H.; Myllyla, R. : Cloning and characterization of a novel human lysyl hydroxylase isoform highly expressed in pancreas and muscle. J. Biol. Chem. 272: 6831-6834,

1997. ; and

[80296] Szpirer, C.; Szpirer, J.; Riviere, M.; Vanvooren, P.; Valtavaara, M.; Myllyla, R. : Localization of the gene encoding a novel isoform of lysyl hydroxylase. Mammalian Genome 8: 707-708, 1.

[80297] Further studies establishing the function and utilities of PLOD2 are found in John Hopkins OMIM database record ID 601865, and in sited publications numbered 6269-6271 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.DKFZP586P0123 (Accession XM_170681) is another VGAM2357 host target gene. DKFZP586P0123 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586P0123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586P0123 BINDING SITE, designated SEQ ID:45462, to the nucleotide sequence of VGAM2357 RNA, herein designated VGAM RNA, also designated SEQ ID:5068.

[80298] Another function of VGAM2357 is therefore inhibition of DKFZP586P0123 (Accession XM_170681). Accordingly,

utilities of VGAM2357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586P0123. Wingless-type MMTV Integration Site Family, Member 2B (WNT2B, Accession NM_004185) is another VGAM2357 host target gene. WNT2B BINDING SITE1 and WNT2B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WNT2B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT2B BINDING SITE1 and WNT2B BINDING SITE2, designated SEQ ID:10390 and SEQ ID:23691 respectively, to the nucleotide sequence of VGAM2357 RNA, herein designated VGAM RNA, also designated SEQ ID:5068.

[80299] Another function of VGAM2357 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 2B (WNT2B, Accession NM_004185). Accordingly, utilities of VGAM2357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT2B. LOC220672 (Accession XM_017177) is another VGAM2357 host target gene. LOC220672 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC220672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220672 BINDING SITE, designated SEQ ID:30306, to the nucleotide sequence of VGAM2357 RNA, herein designated VGAM RNA, also designated SEQ ID:5068.

[80300] Another function of VGAM2357 is therefore inhibition of LOC220672 (Accession XM_017177). Accordingly, utilities of VGAM2357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220672. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2358 (VGAM2358) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80301] VGAM2358 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2358 was detected is described hereinabove with reference to Figs. 1-8.

[80302] VGAM2358 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Equine Herpesvirus 2. VGAM2358 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80303] VGAM2358 gene encodes a VGAM2358 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2358 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2358 precursor RNA is designated SEQ ID:2344, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2344 is located at position 44667 relative to the genome of Equine Herpesvirus 2.

[80304] VGAM2358 precursor RNA folds onto itself, forming VGAM2358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80305] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2358 folded precursor RNA into VGAM2358 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2358 RNA is designated SEQ ID:5069, and is provided hereinbelow with reference to the sequence listing part.

[80306] VGAM2358 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2358 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2358 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80307] VGAM2358 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2358 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2358 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2358 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2358 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80308] The complementary binding of VGAM2358 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2358 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2358

host target RNA into VGAM2358 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80309] It is appreciated that VGAM2358 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2358 host target genes. The mRNA of each one of this plurality of VGAM2358 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2358 RNA, herein designated VGAM RNA, and which when bound by VGAM2358 RNA causes inhibition of translation of respective one or more VGAM2358 host target proteins.

[80310] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2358 gene, herein designated VGAM GENE, on one or more VGAM2358 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80311] It is yet further appreciated that a function of VGAM2358 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2358 correlate with, and may be deduced from, the identity of the host target genes which VGAM2358 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80312] Nucleotide sequences of the VGAM2358 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2358 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2358 are further

described hereinbelow with reference to Table 1.

[80313] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2358 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2358 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80314] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2358 gene, herein designated VGAM is inhibition of expression of VGAM2358 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2358 correlate with, and may be deduced from, the identity of the target genes which VGAM2358 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80315] Alcohol Dehydrogenase IB (class I), Beta Polypeptide (ADH1B, Accession XM_052365) is a VGAM2358 host target gene. ADH1B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADH1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ADH1B BINDING SITE, designated SEQ ID:35962, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80316] A function of VGAM2358 is therefore inhibition of Alcohol Dehydrogenase IB (class I), Beta Polypeptide (ADH1B, Accession XM_052365), a gene which Alcohol dehydrogenase 2 (alcohol:NAD+ oxidoreductase) class I beta subunit. Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADH1B. The function of ADH1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1805.Activation-induced Cytidine Deaminase (AICDA, Accession NM_020661) is another VGAM2358 host target gene. AICDA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AICDA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AICDA BINDING SITE, designated SEQ ID:21833, to the nucleotide sequence of

VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80317] Another function of VGAM2358 is therefore inhibition of Activation-induced Cytidine Deaminase (AICDA, Accession NM_020661), a gene which a member of the cytidine deaminase family. Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AICDA. The function of AICDA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM600.Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM_006380) is another VGAM2358 host target gene. APPBP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APPBP2 BINDING SITE, designated SEQ ID:13085, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80318] Another function of VGAM2358 is therefore inhibition of

Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM_006380), a gene which interacts with the basolateral sorting signal of amyloid precursor protein. Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPBP2. The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM525.ATPase, Ca++ Transporting, Plasma Membrane 4 (ATP2B4, Accession XM_046775) is another VGAM2358 host target gene. ATP2B4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ATP2B4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP2B4 BINDING SITE, designated SEQ ID:34825, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80319] Another function of VGAM2358 is therefore inhibition of ATPase, Ca++ Transporting, Plasma Membrane 4 (ATP2B4, Accession XM_046775). Accordingly, utilities of

VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2B4. BRIP1 (Accession NM_032043) is another VGAM2358 host target gene. BRIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRIP1 BINDING SITE, designated SEQ ID:25758, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80320] Another function of VGAM2358 is therefore inhibition of BRIP1 (Accession NM_032043). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRIP1. Caspase 2, Apoptosis-related Cysteine Protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NM_032982) is another VGAM2358 host target gene. CASP2 BINDING SITE1 through CASP2 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASP2, corresponding to HOST TARGET binding sites such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP2 BINDING SITE1 through CASP2 BINDING SITE4, designated SEQ ID:26856, SEQ ID:26861, SEQ ID:26866 and SEQ ID:6893 respectively, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80321] Another function of VGAM2358 is therefore inhibition of Caspase 2, Apoptosis-related Cysteine Protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NM_032982), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP2. The function of CASP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM148.Core-binding Factor, Beta Subunit (CBFB, Accession NM_001755) is another VGAM2358 host target gene. CBFB BINDING SITE1 and CBFB BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CBFB, corresponding to HOST TAR-

GET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFB BINDING SITE1 and CBFB BINDING SITE2, designated SEQ ID:7508 and SEQ ID:23149 respectively, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80322] Another function of VGAM2358 is therefore inhibition of Core-binding Factor, Beta Subunit (CBFB, Accession NM_001755), a gene which is beta subunit of the transcription factor CBF which causes leukemia. Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFB. The function of CBFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM98.Coronin, Actin Binding Protein, 2B (CORO2B, Accession XM_035403) is another VGAM2358 host target gene. CORO2B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CORO2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of CORO2B BINDING SITE, designated SEQ ID:32257, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80323] Another function of VGAM2358 is therefore inhibition of Coronin, Actin Binding Protein, 2B (CORO2B, Accession XM_035403), a gene which may play a role in the reorganization of neuronal actin structure. Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CORO2B. The function of CORO2B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923.Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147) is another VGAM2358 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42728, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5069.

[80324] Another function of VGAM2358 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1A. The function of EIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.Homeo Box B3 (HOXB3, Accession NM_002146) is another VGAM2358 host target gene. HOXB3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HOXB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXB3 BINDING SITE, designated SEQ ID:7923, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80325] Another function of VGAM2358 is therefore inhibition of Homeo Box B3 (HOXB3, Accession NM_002146). Accord-

ingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB3. Immunoglobulin Superfamily Containing Leucine-rich Repeat (ISLR, Accession NM_005545) is another VGAM2358 host target gene. ISLR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ISLR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ISLR BINDING SITE, designated SEQ ID:12071, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80326] Another function of VGAM2358 is therefore inhibition of Immunoglobulin Superfamily Containing Leucine-rich Repeat (ISLR, Accession NM_005545). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ISLR. Melan-A (MLANA, Accession NM_005511) is another VGAM2358 host target gene. MLANA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MLANA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLANA BINDING SITE, designated SEQ ID:12029, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80327] Another function of VGAM2358 is therefore inhibition of Melan-A (MLANA, Accession NM_005511). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLANA. V-myc Myelocytomatosis Viral Oncogene Homolog 2 (avian) (MYCL2, Accession NM_005377) is another VGAM2358 host target gene. MYCL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCL2 BINDING SITE, designated SEQ ID:11858, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80328] Another function of VGAM2358 is therefore inhibition of V-myc Myelocytomatosis Viral Oncogene Homolog 2 (avian) (MYCL2, Accession NM_005377). Accordingly, util-

ities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCL2. Serine (or cysteine) Proteinase Inhibitor, Clade D (heparin cofactor), Member 1 (SERPIND1, Accession NM_000185) is another VGAM2358 host target gene. SERPIND1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SERPIND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPIND1 BINDING SITE, designated SEQ ID:5687, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80329] Another function of VGAM2358 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade D (heparin cofactor), Member 1 (SERPIND1, Accession NM_000185). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPIND1. Solute Carrier Family 13 (sodium/sulfate symporters), Member 1 (SLC13A1, Accession NM_022444) is another VGAM2358 host target gene. SLC13A1 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by SLC13A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC13A1 BINDING SITE, designated SEQ ID:22776, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80330] Another function of VGAM2358 is therefore inhibition of Solute Carrier Family 13 (sodium/sulfate symporters), Member 1 (SLC13A1, Accession NM_022444). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC13A1. Surfeit 5 (SURF5, Accession NM_006752) is another VGAM2358 host target gene. SURF5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SURF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURF5 BINDING SITE, designated SEQ ID:13607, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80331] Another function of VGAM2358 is therefore inhibition of Surfeit 5 (SURF5, Accession NM_006752). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURF5. TRIM (Accession NM_016388) is another VGAM2358 host target gene. TRIM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM BINDING SITE, designated SEQ ID:18533, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80332] Another function of VGAM2358 is therefore inhibition of TRIM (Accession NM_016388), a gene which plays a role in recruiting signaling proteins to the plasma membrane upon T-cell receptor (TCR) complex activation in T cells. Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM. The function of TRIM and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM227.WAS Protein Family, Member 3 (WASF3, Accession NM_006646) is another VGAM2358 host target gene. WASF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WASF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WASF3 BINDING SITE, designated SEQ ID:13441, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80333] Another function of VGAM2358 is therefore inhibition of WAS Protein Family, Member 3 (WASF3, Accession NM_006646), a gene which stimulates actin polymerization. Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WASF3. The function of WASF3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1692.Williams-Beuren Syndrome Chromosome Region 1 (WBSCR1, Accession NM_022170) is another VGAM2358 host target gene. WBSCR1 BINDING SITE1 and

WBSCR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WBSCR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR1 BINDING SITE1 and WBSCR1 BINDING SITE2, designated SEQ ID:22727 and SEQ ID:25710 respectively, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80334] Another function of VGAM2358 is therefore inhibition of Williams-Beuren Syndrome Chromosome Region 1 (WBSCR1, Accession NM_022170), a gene which stimulates protein translation. Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR1. The function of WBSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM110.Collectin Sub-family Member 12 (COLEC12, Accession NM_030781) is another VGAM2358 host target gene. COLEC12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by COLEC12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COLEC12 BINDING SITE, designated SEQ ID:25073, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80335] Another function of VGAM2358 is therefore inhibition of Collectin Sub-family Member 12 (COLEC12, Accession NM_030781). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLEC12. CRMP5 (Accession NM_020134) is another VGAM2358 host target gene. CRMP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRMP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRMP5 BINDING SITE, designated SEQ ID:21331, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80336] Another function of VGAM2358 is therefore inhibition of

CRMP5 (Accession NM_020134). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRMP5. DDM36 (Accession NM_020962) is another VGAM2358 host target gene. DDM36 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDM36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDM36 BINDING SITE, designated SEQ ID:21957, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80337] Another function of VGAM2358 is therefore inhibition of DDM36 (Accession NM_020962). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDM36. FLJ11710 (Accession NM_024846) is another VGAM2358 host target gene. FLJ11710 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ11710 BINDING SITE, designated SEQ ID:24276, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80338] Another function of VGAM2358 is therefore inhibition of FLJ11710 (Accession NM_024846). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11710. FLJ12078 (Accession NM_024977) is another VGAM2358 host target gene. FLJ12078 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12078 BINDING SITE, designated SEQ ID:24535, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80339] Another function of VGAM2358 is therefore inhibition of FLJ12078 (Accession NM_024977). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12078. FLJ13910 (Accession NM_022780) is another

VGAM2358 host target gene. FLJ13910 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13910 BINDING SITE, designated SEQ ID:23054, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80340] Another function of VGAM2358 is therefore inhibition of FLJ13910 (Accession NM_022780). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13910. FLJ20651 (Accession NM_017919) is another VGAM2358 host target gene. FLJ20651 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20651 BINDING SITE, designated SEQ ID:19577, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80341] Another function of VGAM2358 is therefore inhibition of FLJ20651 (Accession NM_017919). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20651. FLJ20671 (Accession NM_017924) is another VGAM2358 host target gene. FLJ20671 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20671 BINDING SITE, designated SEQ ID:19593, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80342] Another function of VGAM2358 is therefore inhibition of FLJ20671 (Accession NM_017924). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20671. FLJ23024 (Accession NM_024936) is another VGAM2358 host target gene. FLJ23024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23024 BINDING SITE, designated SEQ ID:24474, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80343] Another function of VGAM2358 is therefore inhibition of FLJ23024 (Accession NM_024936). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23024. FLJ23056 (Accession NM_024582) is another VGAM2358 host target gene. FLJ23056 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23056 BINDING SITE, designated SEQ ID:23809, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80344] Another function of VGAM2358 is therefore inhibition of FLJ23056 (Accession NM_024582). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ23056. Frequenin Homolog (Drosophila) (FREQ, Accession NM_014286) is another VGAM2358 host target gene. FREQ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FREQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FREQ BINDING SITE, designated SEQ ID:15562, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80345] Another function of VGAM2358 is therefore inhibition of Frequenin Homolog (Drosophila) (FREQ, Accession NM_014286). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FREQ. GTP Binding Protein 1 (GTPBP1, Accession NM_004286) is another VGAM2358 host target gene. GTPBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GTPBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBP1 BINDING SITE, designated SEQ ID:10497, to the nucleotide sequence of

VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80346] Another function of VGAM2358 is therefore inhibition of GTP Binding Protein 1 (GTPBP1, Accession NM_004286). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBP1. JM11 (Accession NM_033626) is another VGAM2358 host target gene. JM11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by JM11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JM11 BINDING SITE, designated SEQ ID:27330, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80347] Another function of VGAM2358 is therefore inhibition of JM11 (Accession NM_033626). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JM11. KIAA0026 (Accession NM_012286) is another VGAM2358 host target gene. KIAA0026 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by KIAA0026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0026 BINDING SITE, designated SEQ ID:14616, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80348] Another function of VGAM2358 is therefore inhibition of KIAA0026 (Accession NM_012286). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0026. KIAA0152 (Accession NM_014730) is another VGAM2358 host target gene. KIAA0152 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE, designated SEQ ID:16342, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80349] Another function of VGAM2358 is therefore inhibition of KIAA0152 (Accession NM_014730). Accordingly, utilities

of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0152. KIAA0285 (Accession NM_014807) is another VGAM2358 host target gene. KIAA0285 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0285 BINDING SITE, designated SEQ ID:16753, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80350] Another function of VGAM2358 is therefore inhibition of KIAA0285 (Accession NM_014807). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0285. KIAA0513 (Accession NM_014732) is another VGAM2358 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0513 BINDING SITE, designated SEQ ID:16365, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80351] Another function of VGAM2358 is therefore inhibition of KIAA0513 (Accession NM_014732). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA0767 (Accession XM_027105) is another VGAM2358 host target gene. KIAA0767 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0767, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0767 BINDING SITE, designated SEQ ID:30410, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80352] Another function of VGAM2358 is therefore inhibition of KIAA0767 (Accession XM_027105). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0767. KIAA1200 (Accession XM_031054) is another VGAM2358 host target gene. KIAA1200 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1200 BINDING SITE, designated SEQ ID:31265, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80353] Another function of VGAM2358 is therefore inhibition of KIAA1200 (Accession XM_031054). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1200. KIAA1257 (Accession XM_031577) is another VGAM2358 host target gene. KIAA1257 BINDING SITE1 and KIAA1257 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1257, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE1 and KIAA1257 BINDING SITE2, designated SEQ ID:31440 and SEQ ID:31441 respectively, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5069.

[80354] Another function of VGAM2358 is therefore inhibition of KIAA1257 (Accession XM_031577). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257. KIAA1649 (Accession XM_040095) is another VGAM2358 host target gene. KIAA1649 BINDING SITE1 and KIAA1649 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1649, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE1 and KIAA1649 BINDING SITE2, designated SEQ ID:33259 and SEQ ID:26111 respectively, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80355] Another function of VGAM2358 is therefore inhibition of KIAA1649 (Accession XM_040095). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. Kruppel-like Factor 12 (KLF12, Accession NM_016285) is another VGAM2358 host target gene.

KLF12 BINDING SITE1 and KLF12 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KLF12, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF12 BINDING SITE1 and KLF12 BINDING SITE2, designated SEQ ID:18411 and SEQ ID:14120 respectively, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80356] Another function of VGAM2358 is therefore inhibition of Kruppel-like Factor 12 (KLF12, Accession NM_016285). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF12. Mannosidase, Beta A, Lysosomal-like (MANBAL, Accession NM_022077) is another VGAM2358 host target gene. MANBAL BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MANBAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MANBAL BINDING SITE, designated SEQ ID:22622, to the nucleotide

sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80357] Another function of VGAM2358 is therefore inhibition of Mannosidase, Beta A, Lysosomal-like (MANBAL, Accession NM_022077). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MANBAL. MGC14836 (Accession NM_033412) is another VGAM2358 host target gene. MGC14836 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC14836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14836 BINDING SITE, designated SEQ ID:27237, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80358] Another function of VGAM2358 is therefore inhibition of MGC14836 (Accession NM_033412). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14836. MGC3222 (Accession NM_024334) is another VGAM2358 host target gene. MGC3222 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3222 BINDING SITE, designated SEQ ID:23642, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80359] Another function of VGAM2358 is therefore inhibition of MGC3222 (Accession NM_024334). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3222. moblak (Accession NM_130807) is another VGAM2358 host target gene. moblak BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by moblak, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of moblak BINDING SITE, designated SEQ ID:28313, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80360] Another function of VGAM2358 is therefore inhibition of

moblak (Accession NM_130807). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with moblak. NICE-3 (Accession NM_015449) is another VGAM2358 host target gene. NICE-3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NICE-3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NICE-3 BINDING SITE, designated SEQ ID:17735, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80361] Another function of VGAM2358 is therefore inhibition of NICE-3 (Accession NM_015449). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NICE-3. PILR(ALPHA) (Accession NM_013439) is another VGAM2358 host target gene. PILR(ALPHA) BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PILR(ALPHA), corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of PILR(ALPHA) BINDING SITE, designated SEQ ID:15103, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80362] Another function of VGAM2358 is therefore inhibition of PILR(ALPHA) (Accession NM_013439). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PILR(ALPHA). PIP3-E (Accession XM_039749) is another VGAM2358 host target gene. PIP3-E BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIP3-E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:33182, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80363] Another function of VGAM2358 is therefore inhibition of PIP3-E (Accession XM_039749). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E. Quiescin Q6 (QSCN6, Accession NM_002826) is another

VGAM2358 host target gene. QSCN6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by QSCN6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of QSCN6 BINDING SITE, designated SEQ ID:8699, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80364] Another function of VGAM2358 is therefore inhibition of Quiescin Q6 (QSCN6, Accession NM_002826). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with QSCN6. Rpo1-2 (Accession NM_019014) is another VGAM2358 host target gene. Rpo1-2 BINDING SITE1 and Rpo1-2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by Rpo1-2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rpo1-2 BINDING SITE1 and Rpo1-2 BINDING SITE2, designated SEQ ID:21100 and SEQ ID:25933 respectively, to the nucleotide sequence of VGAM2358 RNA,

herein designated VGAM RNA, also designated SEQ ID:5069.

[80365] Another function of VGAM2358 is therefore inhibition of Rpo1-2 (Accession NM_019014). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rpo1-2. Solute Carrier Family 31 (copper transporters), Member 2 (SLC31A2, Accession XM_011776) is another VGAM2358 host target gene. SLC31A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC31A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC31A2 BINDING SITE, designated SEQ ID:30193, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80366] Another function of VGAM2358 is therefore inhibition of Solute Carrier Family 31 (copper transporters), Member 2 (SLC31A2, Accession XM_011776). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC31A2. Williams Beuren Syndrome Chromosome Region

20A (WBSCR20A, Accession NM_032158) is another VGAM2358 host target gene. WBSCR20A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WBSCR20A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WB-SCR20A BINDING SITE, designated SEQ ID:25861, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80367] Another function of VGAM2358 is therefore inhibition of Williams Beuren Syndrome Chromosome Region 20A (WBSCR20A, Accession NM_032158). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR20A. ZFD25 (Accession NM_016220) is another VGAM2358 host target gene. ZFD25 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZFD25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFD25 BINDING SITE, designated SEQ ID:18325, to the nucleotide sequence of

VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80368] Another function of VGAM2358 is therefore inhibition of ZFD25 (Accession NM_016220). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFD25. LOC113675 (Accession NM_138432) is another VGAM2358 host target gene. LOC113675 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC113675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113675 BINDING SITE, designated SEQ ID:28798, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80369] Another function of VGAM2358 is therefore inhibition of LOC113675 (Accession NM_138432). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113675. LOC115294 (Accession XM_054302) is another VGAM2358 host target gene. LOC115294 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC115294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115294 BINDING SITE, designated SEQ ID:36147, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80370] Another function of VGAM2358 is therefore inhibition of LOC115294 (Accession XM_054302). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115294. LOC130813 (Accession XM_065904) is another VGAM2358 host target gene. LOC130813 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:37316, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80371] Another function of VGAM2358 is therefore inhibition of LOC130813 (Accession XM_065904). Accordingly, utilities

of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813. LOC143241 (Accession NM_138812) is another VGAM2358 host target gene. LOC143241 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143241 BINDING SITE, designated SEQ ID:29037, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80372] Another function of VGAM2358 is therefore inhibition of LOC143241 (Accession NM_138812). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143241. LOC144248 (Accession XM_084786) is another VGAM2358 host target gene. LOC144248 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC144248 BINDING SITE, designated SEQ ID:37701, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80373] Another function of VGAM2358 is therefore inhibition of LOC144248 (Accession XM_084786). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144248. LOC144453 (Accession XM_084869) is another VGAM2358 host target gene. LOC144453 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144453 BINDING SITE, designated SEQ ID:37746, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80374] Another function of VGAM2358 is therefore inhibition of LOC144453 (Accession XM_084869). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144453. LOC144571 (Accession XM_096630) is another VGAM2358 host target gene. LOC144571 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144571 BINDING SITE, designated SEQ ID:40441, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80375] Another function of VGAM2358 is therefore inhibition of LOC144571 (Accession XM_096630). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144571. LOC144742 (Accession XM_084949) is another VGAM2358 host target gene. LOC144742 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144742 BINDING SITE, designated SEQ ID:37781, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80376] Another function of VGAM2358 is therefore inhibition of

LOC144742 (Accession XM_084949). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144742. LOC145216 (Accession XM_096730) is another VGAM2358 host target gene. LOC145216 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145216 BINDING SITE, designated SEQ ID:40508, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80377] Another function of VGAM2358 is therefore inhibition of LOC145216 (Accession XM_096730). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145216. LOC146909 (Accession XM_085634) is another VGAM2358 host target gene. LOC146909 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC146909 BINDING SITE, designated SEQ ID:38273, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80378] Another function of VGAM2358 is therefore inhibition of LOC146909 (Accession XM_085634). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146909. LOC148709 (Accession XM_086281) is another VGAM2358 host target gene. LOC148709 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148709 BINDING SITE, designated SEQ ID:38585, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80379] Another function of VGAM2358 is therefore inhibition of LOC148709 (Accession XM_086281). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148709. LOC150054 (Accession XM_097797) is an-

other VGAM2358 host target gene. LOC150054 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150054 BINDING SITE, designated SEQ ID:41127, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80380] Another function of VGAM2358 is therefore inhibition of LOC150054 (Accession XM_097797). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150054. LOC150319 (Accession XM_086816) is another VGAM2358 host target gene. LOC150319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150319 BINDING SITE, designated SEQ ID:38897, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80381] Another function of VGAM2358 is therefore inhibition of LOC150319 (Accession XM_086816). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150319. LOC151475 (Accession XM_098063) is another VGAM2358 host target gene. LOC151475 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151475 BINDING SITE, designated SEQ ID:41361, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80382] Another function of VGAM2358 is therefore inhibition of LOC151475 (Accession XM_098063). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151475. LOC152445 (Accession XM_098231) is another VGAM2358 host target gene. LOC152445 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152445, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152445 BINDING SITE, designated SEQ ID:41514, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80383] Another function of VGAM2358 is therefore inhibition of LOC152445 (Accession XM_098231). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152445. LOC153196 (Accession XM_098323) is another VGAM2358 host target gene. LOC153196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, designated SEQ ID:41590, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80384] Another function of VGAM2358 is therefore inhibition of LOC153196 (Accession XM_098323). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC153196. LOC158310 (Accession XM_098919) is another VGAM2358 host target gene. LOC158310 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158310 BINDING SITE, designated SEQ ID:41951, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80385] Another function of VGAM2358 is therefore inhibition of LOC158310 (Accession XM_098919). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158310. LOC158382 (Accession XM_098931) is another VGAM2358 host target gene. LOC158382 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158382 BINDING SITE, designated SEQ ID:41968, to the nucleotide sequence of VGAM2358 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5069.

[80386] Another function of VGAM2358 is therefore inhibition of LOC158382 (Accession XM_098931). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158382. LOC169611 (Accession XM_095809) is another VGAM2358 host target gene. LOC169611 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC169611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169611 BINDING SITE, designated SEQ ID:40289, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80387] Another function of VGAM2358 is therefore inhibition of LOC169611 (Accession XM_095809). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169611. LOC170082 (Accession XM_093092) is another VGAM2358 host target gene. LOC170082 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC170082, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170082 BINDING SITE, designated SEQ ID:40172, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80388] Another function of VGAM2358 is therefore inhibition of LOC170082 (Accession XM_093092). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170082. LOC200059 (Accession XM_114104) is another VGAM2358 host target gene. LOC200059 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200059 BINDING SITE, designated SEQ ID:42701, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80389] Another function of VGAM2358 is therefore inhibition of LOC200059 (Accession XM_114104). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC200059. LOC200301 (Accession XM_114197) is another VGAM2358 host target gene. LOC200301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200301 BINDING SITE, designated SEQ ID:42785, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80390] Another function of VGAM2358 is therefore inhibition of LOC200301 (Accession XM_114197). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200301. LOC220705 (Accession XM_166000) is another VGAM2358 host target gene. LOC220705 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220705 BINDING SITE, designated SEQ ID:43836, to

the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80391] Another function of VGAM2358 is therefore inhibition of LOC220705 (Accession XM_166000). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220705. LOC221354 (Accession XM_166468) is another VGAM2358 host target gene. LOC221354 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221354 BINDING SITE, designated SEQ ID:44394, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80392] Another function of VGAM2358 is therefore inhibition of LOC221354 (Accession XM_166468). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221354. LOC255454 (Accession XM_175124) is another VGAM2358 host target gene. LOC255454 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC255454, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255454 BINDING SITE, designated SEQ ID:46613, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80393] Another function of VGAM2358 is therefore inhibition of LOC255454 (Accession XM_175124). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255454. LOC255919 (Accession XM_170794) is another VGAM2358 host target gene. LOC255919 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255919 BINDING SITE, designated SEQ ID:45558, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80394] Another function of VGAM2358 is therefore inhibition of LOC255919 (Accession XM_170794). Accordingly, utilities

of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255919. LOC51008 (Accession NM_015947) is another VGAM2358 host target gene. LOC51008 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51008 BINDING SITE, designated SEQ ID:18066, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80395] Another function of VGAM2358 is therefore inhibition of LOC51008 (Accession NM_015947). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51008. LOC90141 (Accession XM_029373) is another VGAM2358 host target gene. LOC90141 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90141 BINDING SITE, designated SEQ ID:30883, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80396] Another function of VGAM2358 is therefore inhibition of LOC90141 (Accession XM_029373). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90141. LOC90333 (Accession XM_030958) is another VGAM2358 host target gene. LOC90333 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:31229, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80397] Another function of VGAM2358 is therefore inhibition of LOC90333 (Accession XM_030958). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. LOC90371 (Accession XM_031261) is another VGAM2358 host target gene. LOC90371 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90371 BINDING SITE, designated SEQ ID:31324, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80398] Another function of VGAM2358 is therefore inhibition of LOC90371 (Accession XM_031261). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90371. LOC91923 (Accession XM_041526) is another VGAM2358 host target gene. LOC91923 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91923 BINDING SITE, designated SEQ ID:33545, to the nucleotide sequence of VGAM2358 RNA, herein designated VGAM RNA, also designated SEQ ID:5069.

[80399] Another function of VGAM2358 is therefore inhibition of

LOC91923 (Accession XM_041526). Accordingly, utilities of VGAM2358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91923. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2359 (VGAM2359) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80400] VGAM2359 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2359 was detected is described hereinabove with reference to Figs. 1-8.

[80401] VGAM2359 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2359 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80402] VGAM2359 gene encodes a VGAM2359 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2359 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2359 precursor RNA is designated SEQ ID:2345, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2345 is located at position 34353 relative to the genome of Equine Herpesvirus 2.

[80403] VGAM2359 precursor RNA folds onto itself, forming VGAM2359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80404] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2359 folded precursor RNA into VGAM2359 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide se-

quence of VGAM2359 RNA is designated SEQ ID:5070, and is provided hereinbelow with reference to the sequence listing part.

[80405] VGAM2359 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2359 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2359 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80406] VGAM2359 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2359 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2359 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2359 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2359 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80407] The complementary binding of VGAM2359 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2359 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2359 host target RNA into VGAM2359 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80408] It is appreciated that VGAM2359 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2359 host target genes. The mRNA of each one of this plurality of VGAM2359 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2359 RNA, herein designated VGAM RNA, and which when bound by VGAM2359 RNA causes inhibition of translation of respective one or more VGAM2359 host target proteins.

[80409] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2359 gene, herein designated VGAM GENE, on one or more VGAM2359 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80410] It is yet further appreciated that a function of VGAM2359

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2359 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2359 correlate with, and may be deduced from, the identity of the host target genes which VGAM2359 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80411] Nucleotide sequences of the VGAM2359 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2359 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2359 are further described hereinbelow with reference to Table 1.

[80412] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2359 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2359 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80413] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2359 gene, herein designated VGAM is inhibition of expression of VGAM2359 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2359 correlate with, and may be deduced from, the identity of the target genes which VGAM2359 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80414] BTG Family, Member 2 (BTG2, Accession NM_006763) is a VGAM2359 host target gene. BTG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTG2 BINDING SITE, designated SEQ ID:13622, to the nucleotide sequence of VGAM2359 RNA, herein designated VGAM RNA, also designated SEQ ID:5070.

[80415] A function of VGAM2359 is therefore inhibition of BTG Family, Member 2 (BTG2, Accession NM_006763). Accordingly, utilities of VGAM2359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTG2. Glutamate Receptor, Ionotropic, Kainate 3

(GRIK3, Accession NM_000831) is another VGAM2359 host target gene. GRIK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRIK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIK3 BINDING SITE, designated SEQ ID:6486, to the nucleotide sequence of VGAM2359 RNA, herein designated VGAM RNA, also designated SEQ ID:5070.

[80416] Another function of VGAM2359 is therefore inhibition of Glutamate Receptor, Ionotropic, Kainate 3 (GRIK3, Accession NM_000831). Accordingly, utilities of VGAM2359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIK3. MLL Septin-like Fusion (MSF, Accession XM_113892) is another VGAM2359 host target gene. MSF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MSF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSF BINDING SITE, designated SEQ ID:42522, to the nucleotide sequence of

VGAM2359 RNA, herein designated VGAM RNA, also designated SEQ ID:5070.

[80417] Another function of VGAM2359 is therefore inhibition of MLL Septin-like Fusion (MSF, Accession XM_113892), a gene which plays a role in the cell cycle. Accordingly, utilities of VGAM2359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSF. The function of MSF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM514.Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession XM_168302) is another VGAM2359 host target gene. ZNF36 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF36 BINDING SITE, designated SEQ ID:45105, to the nucleotide sequence of VGAM2359 RNA, herein designated VGAM RNA, also designated SEQ ID:5070.

[80418] Another function of VGAM2359 is therefore inhibition of Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession

XM_168302), a gene which may be involved in transcriptional regulation. Accordingly, utilities of VGAM2359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF36. The function of ZNF36 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM804.KIAA0469 (Accession NM_014851) is another VGAM2359 host target gene. KIAA0469 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:16888, to the nucleotide sequence of VGAM2359 RNA, herein designated VGAM RNA, also designated SEQ ID:5070.

[80419] Another function of VGAM2359 is therefore inhibition of KIAA0469 (Accession NM_014851). Accordingly, utilities of VGAM2359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1

(SMARCF1, Accession NM_018450) is another VGAM2359 host target gene. SMARCF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMARCF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCF1 BINDING SITE, designated SEQ ID:20518, to the nucleotide sequence of VGAM2359 RNA, herein designated VGAM RNA, also designated SEQ ID:5070.

[80420] Another function of VGAM2359 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM_018450). Accordingly, utilities of VGAM2359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCF1. LOC115708 (Accession XM_056552) is another VGAM2359 host target gene. LOC115708 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115708, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC115708 BINDING SITE, designated SEQ ID:36403, to the nucleotide sequence of VGAM2359 RNA, herein designated VGAM RNA, also designated SEQ ID:5070.

[80421] Another function of VGAM2359 is therefore inhibition of LOC115708 (Accession XM_056552). Accordingly, utilities of VGAM2359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115708. LOC51754 (Accession XM_048528) is another VGAM2359 host target gene. LOC51754 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51754, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51754 BINDING SITE, designated SEQ ID:35179, to the nucleotide sequence of VGAM2359 RNA, herein designated VGAM RNA, also designated SEQ ID:5070.

[80422] Another function of VGAM2359 is therefore inhibition of LOC51754 (Accession XM_048528). Accordingly, utilities of VGAM2359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51754. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2360 (VGAM2360) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80423] VGAM2360 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2360 was detected is described hereinabove with reference to Figs. 1-8.

[80424] VGAM2360 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2360 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80425] VGAM2360 gene encodes a VGAM2360 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2360 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2360 precursor RNA is designated SEQ ID:2346, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2346 is located at position 40669 relative to the

genome of Equine Herpesvirus 2.

[80426] VGAM2360 precursor RNA folds onto itself, forming VGAM2360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80427] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2360 folded precursor RNA into VGAM2360 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2360 RNA is designated SEQ ID:5071, and is provided hereinbelow with reference to the sequence listing part.

[80428] VGAM2360 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2360 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2360 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80429] VGAM2360 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2360 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2360 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2360 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2360 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80430] The complementary binding of VGAM2360 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2360 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2360 host target RNA into VGAM2360 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80431] It is appreciated that VGAM2360 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2360 host target genes. The mRNA of each one of this plurality of VGAM2360 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2360 RNA, herein designated VGAM RNA, and which when bound by VGAM2360 RNA causes inhibition of translation of respective one or more VGAM2360 host target proteins.

[80432] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2360 gene, herein designated VGAM GENE, on one or more VGAM2360 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80433] It is yet further appreciated that a function of VGAM2360 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2360 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2360

correlate with, and may be deduced from, the identity of the host target genes which VGAM2360 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80434] Nucleotide sequences of the VGAM2360 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2360 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2360 are further described hereinbelow with reference to Table 1.

[80435] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2360 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2360 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80436] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2360 gene, herein designated VGAM is inhibition of expression of VGAM2360 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2360 correlate with, and may be deduced

from, the identity of the target genes which VGAM2360 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80437] General Transcription Factor II, I (GTF2I, Accession NM_032999) is a VGAM2360 host target gene. GTF2I BINDING SITE1 and GTF2I BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GTF2I, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2I BINDING SITE1 and GTF2I BINDING SITE2, designated SEQ ID:26885 and SEQ ID:26889 respectively, to the nucleotide sequence of VGAM2360 RNA, herein designated VGAM RNA, also designated SEQ ID:5071.

[80438] A function of VGAM2360 is therefore inhibition of General Transcription Factor II, I (GTF2I, Accession NM_032999), a gene which interacts with the basal transcription machinery by coordinating the formation of a multiprotein complex at the c-fos promoter, and linking specific signal responsive activator complexes. Accordingly, utilities of VGAM2360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2I.

The function of GTF2I and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM115.FLJ13441 (Accession NM_023924) is another VGAM2360 host target gene. FLJ13441 BINDING SITE1 and FLJ13441 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ13441, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13441 BINDING SITE1 and FLJ13441 BINDING SITE2, designated SEQ ID:23397 and SEQ ID:23398 respectively, to the nucleotide sequence of VGAM2360 RNA, herein designated VGAM RNA, also designated SEQ ID:5071.

[80439] Another function of VGAM2360 is therefore inhibition of FLJ13441 (Accession NM_023924). Accordingly, utilities of VGAM2360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13441. KIAA1904 (Accession XM_056282) is another VGAM2360 host target gene. KIAA1904 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1904, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE, designated SEQ ID:36376, to the nucleotide sequence of VGAM2360 RNA, herein designated VGAM RNA, also designated SEQ ID:5071.

[80440] Another function of VGAM2360 is therefore inhibition of KIAA1904 (Accession XM_056282). Accordingly, utilities of VGAM2360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904. POPX1 (Accession NM_014906) is another VGAM2360 host target gene. POPX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POPX1 BINDING SITE, designated SEQ ID:17120, to the nucleotide sequence of VGAM2360 RNA, herein designated VGAM RNA, also designated SEQ ID:5071.

[80441] Another function of VGAM2360 is therefore inhibition of POPX1 (Accession NM_014906). Accordingly, utilities of VGAM2360 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with POPX1. Solute Carrier Family 1 (glutamate transporter), Member 7 (SLC1A7, Accession NM_006671) is another VGAM2360 host target gene. SLC1A7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC1A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A7 BINDING SITE, designated SEQ ID:13489, to the nucleotide sequence of VGAM2360 RNA, herein designated VGAM RNA, also designated SEQ ID:5071.

[80442] Another function of VGAM2360 is therefore inhibition of Solute Carrier Family 1 (glutamate transporter), Member 7 (SLC1A7, Accession NM_006671). Accordingly, utilities of VGAM2360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A7. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2361 (VGAM2361) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[80443] VGAM2361 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2361 was detected is described hereinabove with reference to Figs. 1-8.

[80444] VGAM2361 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2361 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80445] VGAM2361 gene encodes a VGAM2361 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2361 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2361 precursor RNA is designated SEQ ID:2347, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2347 is located at position 23557 relative to the genome of Equine Herpesvirus 2.

[80446] VGAM2361 precursor RNA folds onto itself, forming VGAM2361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80447] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2361 folded precursor RNA into VGAM2361 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2361 RNA is designated SEQ ID:5072, and is provided hereinbelow with reference to the sequence listing part.

[80448] VGAM2361 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2361 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2361 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80449] VGAM2361 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2361 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2361 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2361 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2361 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[80450] The complementary binding of VGAM2361 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2361 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2361 host target RNA into VGAM2361 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80451] It is appreciated that VGAM2361 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2361 host target genes. The mRNA of each one of this plurality of VGAM2361 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2361 RNA, herein designated VGAM RNA, and which when bound by VGAM2361 RNA causes inhibition of translation of respective one or more VGAM2361 host target proteins.

[80452] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2361 gene, herein designated VGAM GENE, on one

or more VGAM2361 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80453] It is yet further appreciated that a function of VGAM2361 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2361 correlate with, and may be deduced from, the identity of the host target genes which VGAM2361 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80454] Nucleotide sequences of the VGAM2361 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2361 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2361 are further described hereinbelow with reference to Table 1.

[80455] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2361 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2361 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80456] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2361 gene, herein designated VGAM is inhibition of expression of VGAM2361 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2361 correlate with, and may be deduced from, the identity of the target genes which VGAM2361 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80457] Amyloid Beta (A4) Precursor Protein-binding, Family A,

Member 2 (X11-like) (APBA2, Accession NM_005503) is a VGAM2361 host target gene. APBA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APBA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APBA2 BINDING SITE, designated SEQ ID:12017, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80458] A function of VGAM2361 is therefore inhibition of Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 2 (X11-like) (APBA2, Accession NM_005503), a gene which interacts with and stabilisesthe Alzheimer's disease amyloid precursor protein (APP) and inhibits production of proteolytic APP fragments. Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APBA2. The function of APBA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM925.EphA8 (EPHA8, Accession NM_020526) is another VGAM2361 host target gene. EPHA8 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA8 BINDING SITE, designated SEQ ID:21747, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80459] Another function of VGAM2361 is therefore inhibition of EphA8 (EPHA8, Accession NM_020526), a gene which Eph-related receptor tyrosine kinase A8. Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA8. The function of EPHA8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM494.Ellis Van Creveld Syndrome (EVC, Accession NM_014556) is another VGAM2361 host target gene. EVC BINDING SITE1 through EVC BINDING SITE8 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EVC, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of EVC BINDING SITE1 through EVC BINDING SITE8, designated SEQ ID:15890, SEQ ID:15891, SEQ ID:15892, SEQ ID:15893, SEQ ID:15888, SEQ ID:15889, SEQ ID:15887 and SEQ ID:15886 respectively, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80460] Another function of VGAM2361 is therefore inhibition of Ellis Van Creveld Syndrome (EVC, Accession NM_014556). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC. Potassium Inwardly-rectifying Channel, Subfamily J, Member 10 (KCNJ10, Accession NM_002241) is another VGAM2361 host target gene. KCNJ10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNJ10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ10 BINDING SITE, designated SEQ ID:8025, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80461] Another function of VGAM2361 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 10 (KCNJ10, Accession NM_002241), a gene which may be responsible for potassium buffering action of glial cells in the brain. Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ10. The function of KCNJ10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM167.Potassium Voltage-gated Channel, KQT-like Subfamily, Member 1 (KCNQ1, Accession NM_000218) is another VGAM2361 host target gene. KCNQ1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNQ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNQ1 BINDING SITE, designated SEQ ID:5724, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80462] Another function of VGAM2361 is therefore inhibition of Potassium Voltage-gated Channel, KQT-like Subfamily,

Member 1 (KCNQ1, Accession NM_000218), a gene which probably important in cardiac repolarization. associates with kcne1 (mink) to form the i(ks) cardiac potassium current. elicits a rapidly activating, k(+)-selective outward current. muscarinic agonist oxotremorine-m strongly suppresses kcnq1/kcne1 current in cho cells in which cloned kcnq1/kcne1 channels were coexpressed with m1 muscarinic receptors. may associate also with kcne3 (mirp2) to form the potassium channel that is important for cyclic amp-stimulated intestinal secretion of chloride io TISSUE:abondantly expressed in heart, pancreas, prostate, kidney, small intestine and peripheral blood leukocytes. less abondant in placenta, lung, spleen, colon, thymus, testis and ovaries. Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNQ1. The function of KCNQ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM339.Loss of Heterozygosity, 11, Chromosomal Region 2, Gene A (LOH11CR2A, Accession NM_014622) is another VGAM2361 host target gene. LOH11CR2A BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOH11CR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOH11CR2A BINDING SITE, designated SEQ ID:15988, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80463] Another function of VGAM2361 is therefore inhibition of Loss of Heterozygosity, 11, Chromosomal Region 2, Gene A (LOH11CR2A, Accession NM_014622). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOH11CR2A. Mitogen-activated Protein Kinase Kinase Kinase 14 (MAP3K14, Accession NM_003954) is another VGAM2361 host target gene. MAP3K14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K14 BINDING SITE, designated SEQ ID:10091, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80464] Another function of VGAM2361 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 14 (MAP3K14, Accession NM_003954), a gene which is involved in the activation of nf-kappa-b and its transcriptional activity. induces the processing of nf-kappa-b 2/p100. could act in a receptor-selective manner (by similarity). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K14. The function of MAP3K14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM_002531) is another VGAM2361 host target gene. NTSR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NTSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTSR1 BINDING SITE, designated SEQ ID:8369, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80465] Another function of VGAM2361 is therefore inhibition of Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM_002531), a gene which is associated with g proteins that activate a phosphatidylinositol- calcium second messenger system. Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTSR1. The function of NTSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.SRY (sex determining region Y)-box 10 (SOX10, Accession NM_006941) is another VGAM2361 host target gene. SOX10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX10 BINDING SITE, designated SEQ ID:13823, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80466] Another function of VGAM2361 is therefore inhibition of SRY (sex determining region Y)-box 10 (SOX10, Accession

NM_006941). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX10. Sphingosine Kinase 2 (SPHK2, Accession NM_020126) is another VGAM2361 host target gene. SPHK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPHK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPHK2 BINDING SITE, designated SEQ ID:21313, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80467] Another function of VGAM2361 is therefore inhibition of Sphingosine Kinase 2 (SPHK2, Accession NM_020126). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPHK2. Collectin Sub-family Member 10 (C-type lectin) (COLEC10, Accession NM_006438) is another VGAM2361 host target gene. COLEC10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COLEC10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COLEC10 BINDING SITE, designated SEQ ID:13146, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80468] Another function of VGAM2361 is therefore inhibition of Collectin Sub-family Member 10 (C-type lectin) (COLEC10, Accession NM_006438). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLEC10. DKFZP434L0117 (Accession NM_022778) is another VGAM2361 host target gene. DKFZP434L0117 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434L0117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L0117 BINDING SITE, designated SEQ ID:23051, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80469] Another function of VGAM2361 is therefore inhibition of DKFZP434L0117 (Accession NM_022778). Accordingly,

utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L0117. FLJ20123 (Accession NM_017674) is another VGAM2361 host target gene. FLJ20123 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20123 BINDING SITE, designated SEQ ID:19218, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80470] Another function of VGAM2361 is therefore inhibition of FLJ20123 (Accession NM_017674). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20123. FLJ20160 (Accession NM_017694) is another VGAM2361 host target gene. FLJ20160 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20160

BINDING SITE, designated SEQ ID:19258, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80471] Another function of VGAM2361 is therefore inhibition of FLJ20160 (Accession NM_017694). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20160. KIAA0855 (Accession NM_015003) is another VGAM2361 host target gene. KIAA0855 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0855 BINDING SITE, designated SEQ ID:17372, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80472] Another function of VGAM2361 is therefore inhibition of KIAA0855 (Accession NM_015003). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0855. KIAA1086 (Accession XM_047610) is another VGAM2361 host target gene. KIAA1086 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1086 BINDING SITE, designated SEQ ID:35012, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80473] Another function of VGAM2361 is therefore inhibition of KIAA1086 (Accession XM_047610). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1086. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840) is another VGAM2361 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30775, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80474] Another function of VGAM2361 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. Retinoic Acid Induced 1 (RAI1, Accession XM_016259) is another VGAM2361 host target gene. RAI1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI1 BINDING SITE, designated SEQ ID:30253, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80475] Another function of VGAM2361 is therefore inhibition of Retinoic Acid Induced 1 (RAI1, Accession XM_016259). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI1. LOC112476 (Accession NM_145239) is another VGAM2361 host target gene. LOC112476 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

LOC112476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112476 BINDING SITE, designated SEQ ID:29751, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80476] Another function of VGAM2361 is therefore inhibition of LOC112476 (Accession NM_145239). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112476. LOC149464 (Accession XM_097645) is another VGAM2361 host target gene. LOC149464 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149464 BINDING SITE, designated SEQ ID:40993, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80477] Another function of VGAM2361 is therefore inhibition of LOC149464 (Accession XM_097645). Accordingly, utilities

of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149464. LOC151959 (Accession XM_098144) is another VGAM2361 host target gene. LOC151959 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151959, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151959 BINDING SITE, designated SEQ ID:41408, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80478] Another function of VGAM2361 is therefore inhibition of LOC151959 (Accession XM_098144). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151959. LOC158969 (Accession XM_088728) is another VGAM2361 host target gene. LOC158969 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC158969 BINDING SITE, designated SEQ ID:39921, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80479] Another function of VGAM2361 is therefore inhibition of LOC158969 (Accession XM_088728). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158969. LOC166206 (Accession XM_093743) is another VGAM2361 host target gene. LOC166206 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC166206, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166206 BINDING SITE, designated SEQ ID:40208, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80480] Another function of VGAM2361 is therefore inhibition of LOC166206 (Accession XM_093743). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166206. LOC197196 (Accession XM_117003) is another VGAM2361 host target gene. LOC197196 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197196 BINDING SITE, designated SEQ ID:43202, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80481] Another function of VGAM2361 is therefore inhibition of LOC197196 (Accession XM_117003). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197196. LOC200081 (Accession XM_114110) is another VGAM2361 host target gene. LOC200081 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200081 BINDING SITE, designated SEQ ID:42704, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80482] Another function of VGAM2361 is therefore inhibition of

LOC200081 (Accession XM_114110). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200081. LOC220045 (Accession XM_167820) is another VGAM2361 host target gene. LOC220045 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220045 BINDING SITE, designated SEQ ID:44860, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80483] Another function of VGAM2361 is therefore inhibition of LOC220045 (Accession XM_167820). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220045. LOC221042 (Accession XM_167669) is another VGAM2361 host target gene. LOC221042 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC221042 BINDING SITE, designated SEQ ID:44757, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80484] Another function of VGAM2361 is therefore inhibition of LOC221042 (Accession XM_167669). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221042. LOC253842 (Accession XM_173230) is another VGAM2361 host target gene. LOC253842 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253842 BINDING SITE, designated SEQ ID:46502, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80485] Another function of VGAM2361 is therefore inhibition of LOC253842 (Accession XM_173230). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253842. LOC257479 (Accession XM_171548) is an-

other VGAM2361 host target gene. LOC257479 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257479 BINDING SITE, designated SEQ ID:46051, to the nucleotide sequence of VGAM2361 RNA, herein designated VGAM RNA, also designated SEQ ID:5072.

[80486] Another function of VGAM2361 is therefore inhibition of LOC257479 (Accession XM_171548). Accordingly, utilities of VGAM2361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257479. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2362 (VGAM2362) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80487] VGAM2362 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2362 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[80488] VGAM2362 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2362 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80489] VGAM2362 gene encodes a VGAM2362 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2362 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2362 precursor RNA is designated SEQ ID:2348, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2348 is located at position 25075 relative to the genome of Equine Herpesvirus 2.

[80490] VGAM2362 precursor RNA folds onto itself, forming VGAM2362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80491] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2362 folded precursor RNA into VGAM2362 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2362 RNA is designated SEQ ID:5073, and is provided hereinbelow with reference to the sequence listing part.

[80492] VGAM2362 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2362 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2362 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80493] VGAM2362 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2362 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2362 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2362 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2362 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80494] The complementary binding of VGAM2362 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2362 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2362 host target RNA into VGAM2362 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80495] It is appreciated that VGAM2362 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2362 host target genes. The mRNA of each one of this plurality of VGAM2362 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2362 RNA, herein designated VGAM RNA, and which when bound by VGAM2362 RNA causes inhibition of translation of respective one or more VGAM2362 host target proteins.

[80496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2362 gene, herein designated VGAM GENE, on one or more VGAM2362 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80497] It is yet further appreciated that a function of VGAM2362 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2362 correlate with, and may be deduced from, the identity of the host target genes which VGAM2362 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80498] Nucleotide sequences of the VGAM2362 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2362 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2362 are further described hereinbelow with reference to Table 1.

[80499] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2362 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2362 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80500] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2362 gene, herein designated VGAM is inhibition of expression of VGAM2362 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2362 correlate with, and may be deduced from, the identity of the target genes which VGAM2362 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80501] Dolichyl-diphosphooligosaccharide-protein Glycosyltransferase (DDOST, Accession NM_005216) is a VGAM2362 host target gene. DDOST BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDOST, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDOST BINDING SITE, designated SEQ ID:11712, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80502] A function of VGAM2362 is therefore inhibition of Dolichyl-diphosphooligosaccharide-protein Glycosyltransferase (DDOST, Accession NM_005216), a gene which transfers high-mannose oligosaccharides to nascent polypeptides. Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDOST. The function of DDOST has been established by previous studies. The enzyme oligosaccharyltransferase (dolichyl-diphosphooligosaccharide-protein glycosyltransferase (DDOST); EC 2.4.1.119) catalyzes the transfer of a high-mannose oligosaccharide from a dolichyl-linked oligosaccharide donor onto the asparagine acceptor site in nascent polypeptide chains across the membrane of the rough endoplasmic reticulum. Kelleher et al. (1992) reported that mammalian oligosaccharyltransferase activity is associated with a protein complex composed of ri-

bophorin I (OMIM Ref. No. 180470), ribophorin II (OMIM Ref. No. 180490), and a 48-kD protein, OST48.

[80503] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[80504] Kelleher, D. J.; Kreibich, G.; Gilmore, R. : Oligosaccharyl-transferase activity is associated with a protein complex composed of ribophorins I and II and a 48 kd protein. Cell 69: 55-65, 1992. ; and

[80505] Yamagata, T.; Tsuru, T.; Momoi, M. Y.; Suwa, K.; Nozaki, Y.; Mukasa, T.; Ohashi, H.; Fukushima, Y.; Momoi, T. : Genome organization of human 48-kDa oligosaccharyl-transferase (DDOST). Ge.

[80506] Further studies establishing the function and utilities of DDOST are found in John Hopkins OMIM database record ID 602202, and in sited publications numbered 2682 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Frizzled Homolog 1 (Drosophila) (FZD1, Accession NM_003505) is another VGAM2362 host target gene. FZD1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FZD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD1 BINDING SITE, designated SEQ ID:9595, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80507] Another function of VGAM2362 is therefore inhibition of Frizzled Homolog 1 (Drosophila) (FZD1, Accession NM_003505), a gene which may be involved in bone resorption; strongly similar to rat Fzd. Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD1. The function of FZD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM432.Histone Deacetylase 4 (HDAC4, Accession NM_006037) is another VGAM2362 host target gene. HDAC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HDAC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC4 BINDING SITE, designated SEQ ID:12664, to the nucleotide sequence of VGAM2362 RNA,

herein designated VGAM RNA, also designated SEQ ID:5073.

[80508] Another function of VGAM2362 is therefore inhibition of Histone Deacetylase 4 (HDAC4, Accession NM_006037), a gene which is responsible for the deacetylation of lysine residues on the n-terminal part of the core histones and may mediate transcriptional regulation. Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC4. The function of HDAC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264.Neuron Navigator 2 (NAV2, Accession XM_012028) is another VGAM2362 host target gene. NAV2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NAV2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAV2 BINDING SITE, designated SEQ ID:30204, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80509] Another function of VGAM2362 is therefore inhibition of

Neuron Navigator 2 (NAV2, Accession XM_012028), a gene which plays an important role in neuronal development, including neurite outgrowth. Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAV2. The function of NAV2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481.Peroxisome Biogenesis Factor 10 (PEX10, Accession NM_002617) is another VGAM2362 host target gene. PEX10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PEX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX10 BINDING SITE, designated SEQ ID:8481, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80510] Another function of VGAM2362 is therefore inhibition of Peroxisome Biogenesis Factor 10 (PEX10, Accession NM_002617). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PEX10. Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM_167769) is another VGAM2362 host target gene. C11orf11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf11 BINDING SITE, designated SEQ ID:44788, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80511] Another function of VGAM2362 is therefore inhibition of Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM_167769). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf11. DKFZp434F1719 (Accession NM_032248) is another VGAM2362 host target gene. DKFZp434F1719 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434F1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of DKFZp434F1719 BINDING SITE, designated SEQ ID:25990, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80512] Another function of VGAM2362 is therefore inhibition of DKFZp434F1719 (Accession NM_032248). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F1719. FLJ20013 (Accession NM_017621) is another VGAM2362 host target gene. FLJ20013 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20013 BINDING SITE, designated SEQ ID:19122, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80513] Another function of VGAM2362 is therefore inhibition of FLJ20013 (Accession NM_017621). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20013. G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_014776) is another VGAM2362 host target gene. GIT2 BINDING SITE1 through GIT2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GIT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE1 through GIT2 BINDING SITE3, designated SEQ ID:16602, SEQ ID:27684 and SEQ ID:27697 respectively, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80514] Another function of VGAM2362 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_014776). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. IDN3 (Accession NM_015384) is another VGAM2362 host target gene. IDN3 BINDING SITE1 and IDN3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by IDN3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementar-

ity of the nucleotide sequences of IDN3 BINDING SITE1 and IDN3 BINDING SITE2, designated SEQ ID:17684 and SEQ ID:26105 respectively, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80515] Another function of VGAM2362 is therefore inhibition of IDN3 (Accession NM_015384). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDN3. KIAA1884 (Accession XM_055539) is another VGAM2362 host target gene. KIAA1884 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1884 BINDING SITE, designated SEQ ID:36297, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80516] Another function of VGAM2362 is therefore inhibition of KIAA1884 (Accession XM_055539). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1884. KIAA1944 (Accession XM_062545) is another VGAM2362 host target gene. KIAA1944 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1944 BINDING SITE, designated SEQ ID:37231, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80517] Another function of VGAM2362 is therefore inhibition of KIAA1944 (Accession XM_062545). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1944. LOC151162 (Accession XM_098012) is another VGAM2362 host target gene. LOC151162 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151162 BINDING SITE, designated SEQ ID:41306, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80518] Another function of VGAM2362 is therefore inhibition of LOC151162 (Accession XM_098012). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151162. LOC203377 (Accession XM_117540) is another VGAM2362 host target gene. LOC203377 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203377, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203377 BINDING SITE, designated SEQ ID:43541, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80519] Another function of VGAM2362 is therefore inhibition of LOC203377 (Accession XM_117540). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203377. LOC221576 (Accession XM_168088) is another VGAM2362 host target gene. LOC221576 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221576 BINDING SITE, designated SEQ ID:45000, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80520] Another function of VGAM2362 is therefore inhibition of LOC221576 (Accession XM_168088). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221576. LOC253573 (Accession XM_173110) is another VGAM2362 host target gene. LOC253573 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253573 BINDING SITE, designated SEQ ID:46366, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80521] Another function of VGAM2362 is therefore inhibition of LOC253573 (Accession XM_173110). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253573. LOC257515 (Accession XM_175211) is another VGAM2362 host target gene. LOC257515 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257515 BINDING SITE, designated SEQ ID:46684, to the nucleotide sequence of VGAM2362 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5073.

[80522] Another function of VGAM2362 is therefore inhibition of LOC257515 (Accession XM_175211). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257515. LOC257572 (Accession XM_175294) is another VGAM2362 host target gene. LOC257572 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257572, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257572 BINDING SITE, designated SEQ ID:46745, to the nucleotide sequence of VGAM2362 RNA, herein designated VGAM RNA, also designated SEQ ID:5073.

[80523] Another function of VGAM2362 is therefore inhibition of LOC257572 (Accession XM_175294). Accordingly, utilities of VGAM2362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257572. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2363 (VGAM2363) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80524] VGAM2363 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2363 was detected is described hereinabove with reference to Figs. 1-8.

[80525] VGAM2363 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2363 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80526] VGAM2363 gene encodes a VGAM2363 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2363 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2363 precursor RNA is designated SEQ ID:2349, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2349 is located at position 40183 relative to the genome of Equine Herpesvirus 2.

[80527] VGAM2363 precursor RNA folds onto itself, forming

VGAM2363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80528] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2363 folded precursor RNA into VGAM2363 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2363 RNA is designated SEQ ID:5074, and is provided hereinbelow with reference to the sequence listing part.

[80529] VGAM2363 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2363 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2363 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80530] VGAM2363 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2363 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2363 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2363 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2363 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80531] The complementary binding of VGAM2363 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2363 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2363 host target RNA into VGAM2363 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80532] It is appreciated that VGAM2363 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2363 host target genes. The mRNA of each one of this plurality of VGAM2363 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2363 RNA, herein designated VGAM RNA, and which when bound by VGAM2363 RNA causes inhibition of translation of respective one or more VGAM2363 host target proteins.

[80533] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2363 gene, herein designated VGAM GENE, on one or more VGAM2363 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80534] It is yet further appreciated that a function of VGAM2363 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2363 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2363 correlate with, and may be deduced from, the identity of the host target genes which VGAM2363 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[80535] Nucleotide sequences of the VGAM2363 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2363 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2363 are further described hereinbelow with reference to Table 1.

[80536] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2363 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2363 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80537] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2363 gene, herein designated VGAM is inhibition of expression of VGAM2363 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2363 correlate with, and may be deduced from, the identity of the target genes which VGAM2363 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[80538] Megakaryocyte-associated Tyrosine Kinase (MATK, Accession NM_002378) is a VGAM2363 host target gene. MATK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MATK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MATK BINDING SITE, designated SEQ ID:8194, to the nucleotide sequence of VGAM2363 RNA, herein designated VGAM RNA, also designated SEQ ID:5074.

[80539] A function of VGAM2363 is therefore inhibition of Megakaryocyte-associated Tyrosine Kinase (MATK, Accession NM_002378), a gene which can phosphorylate members of the SRC family of PTKs at the regulatory tyrosine residue. Accordingly, utilities of VGAM2363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MATK. The function of MATK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2173.Fatty Acid Desaturase 2 (FADS2, Accession NM_004265) is another VGAM2363 host target gene. FADS2 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FADS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FADS2 BINDING SITE, designated SEQ ID:10469, to the nucleotide sequence of VGAM2363 RNA, herein designated VGAM RNA, also designated SEQ ID:5074.

[80540] Another function of VGAM2363 is therefore inhibition of Fatty Acid Desaturase 2 (FADS2, Accession NM_004265). Accordingly, utilities of VGAM2363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FADS2. FK506 Binding Protein 9, 63 KDa (FKBP9, Accession XM_168403) is another VGAM2363 host target gene. FKBP9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP9 BINDING SITE, designated SEQ ID:45146, to the nucleotide sequence of VGAM2363 RNA, herein designated VGAM RNA, also designated SEQ ID:5074.

[80541] Another function of VGAM2363 is therefore inhibition of FK506 Binding Protein 9, 63 KDa (FKBP9, Accession XM_168403). Accordingly, utilities of VGAM2363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP9. KIAA0318 (Accession XM_044334) is another VGAM2363 host target gene. KIAA0318 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0318 BINDING SITE, designated SEQ ID:34187, to the nucleotide sequence of VGAM2363 RNA, herein designated VGAM RNA, also designated SEQ ID:5074.

[80542] Another function of VGAM2363 is therefore inhibition of KIAA0318 (Accession XM_044334). Accordingly, utilities of VGAM2363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0318. KIAA1524 (Accession XM_056015) is another VGAM2363 host target gene. KIAA1524 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1524, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1524 BINDING SITE, designated SEQ ID:36360, to the nucleotide sequence of VGAM2363 RNA, herein designated VGAM RNA, also designated SEQ ID:5074.

[80543] Another function of VGAM2363 is therefore inhibition of KIAA1524 (Accession XM_056015). Accordingly, utilities of VGAM2363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1524. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2364 (VGAM2364) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80544] VGAM2364 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2364 was detected is described hereinabove with reference to Figs. 1-8.

[80545] VGAM2364 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2.

VGAM2364 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80546] VGAM2364 gene encodes a VGAM2364 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2364 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2364 precursor RNA is designated SEQ ID:2350, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2350 is located at position 23189 relative to the genome of Equine Herpesvirus 2.

[80547] VGAM2364 precursor RNA folds onto itself, forming VGAM2364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80548] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2364 folded precursor RNA into VGAM2364 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM2364 RNA is designated SEQ ID:5075, and is provided hereinbelow with reference to the sequence listing part.

[80549] VGAM2364 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2364 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2364 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80550] VGAM2364 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2364 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2364 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2364 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2364 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80551] The complementary binding of VGAM2364 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2364 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2364 host target RNA into VGAM2364 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80552] It is appreciated that VGAM2364 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2364 host target genes. The mRNA of each one of this plurality of VGAM2364 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2364 RNA, herein designated VGAM RNA, and which when bound by VGAM2364 RNA causes inhibition of translation of respective one or more VGAM2364 host target proteins.

[80553] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2364 gene, herein designated VGAM GENE, on one or more VGAM2364 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80554] It is yet further appreciated that a function of VGAM2364 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2364 correlate with, and may be deduced from, the identity of the host target genes which VGAM2364 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80555] Nucleotide sequences of the VGAM2364 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2364 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2364 are further described hereinbelow with reference to Table 1.

[80556] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2364 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2364 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80557] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2364 gene, herein designated VGAM is inhibition of expression of VGAM2364 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2364 correlate with, and may be deduced from, the identity of the target genes which VGAM2364 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80558] ATP-binding Cassette, Sub-family D (ALD), Member 4 (ABCD4, Accession NM_020326) is a VGAM2364 host target gene. ABCD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD4 BINDING SITE, designated SEQ

ID:21590, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80559] A function of VGAM2364 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 4 (ABCD4, Accession NM_020326), a gene which Putative peroxisomal ATP binding cassette transporter. Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD4. The function of ABCD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1924.Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM_014246) is another VGAM2364 host target gene. CELSR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CELSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR1 BINDING SITE, designated SEQ ID:15512, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5075.

[80560] Another function of VGAM2364 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM_014246), a gene which is involved in contact-mediated communication. Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR1. The function of CELSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459.Hydroxysteroid (17-beta) Dehydrogenase 1 (HSD17B1, Accession NM_000413) is another VGAM2364 host target gene. HSD17B1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSD17B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSD17B1 BINDING SITE, designated SEQ ID:5995, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80561] Another function of VGAM2364 is therefore inhibition of

Hydroxysteroid (17-beta) Dehydrogenase 1 (HSD17B1, Accession NM_000413). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSD17B1. Integrin, Alpha 4 (antigen CD49D, alpha 4 subunit of VLA-4 receptor) (ITGA4, Accession NM_000885) is another VGAM2364 host target gene. ITGA4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ITGA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA4 BINDING SITE, designated SEQ ID:6581, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80562] Another function of VGAM2364 is therefore inhibition of Integrin, Alpha 4 (antigen CD49D, alpha 4 subunit of VLA-4 receptor) (ITGA4, Accession NM_000885), a gene which recognizes one or more domains within the alternatively spliced cs-1 and cs-5 regions of fibronectin. Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA4. The function of ITGA4 and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1096.Myelin Basic Protein (MBP, Accession XM_117096) is another VGAM2364 host target gene. MBP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBP BINDING SITE, designated SEQ ID:43220, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80563] Another function of VGAM2364 is therefore inhibition of Myelin Basic Protein (MBP, Accession XM_117096), a gene which Myelin basic protein; a constituent of myelin, plays a role in nerve function. Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBP. The function of MBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_015866) is another VGAM2364

host target gene. PRDM2 BINDING SITE1 and PRDM2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PRDM2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE1 and PRDM2 BINDING SITE2, designated SEQ ID:18000 and SEQ ID:14532 respectively, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80564] Another function of VGAM2364 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_015866), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.Synaptogyrin 1 (SYNGR1, Accession NM_004711) is another VGAM2364 host target gene. SYNGR1 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by SYNGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE, designated SEQ ID:11064, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80565] Another function of VGAM2364 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NM_004711), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107.FLJ11053 (Accession XM_114194) is another VGAM2364 host target gene. FLJ11053 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11053 BINDING SITE, designated SEQ ID:42777, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80566] Another function of VGAM2364 is therefore inhibition of FLJ11053 (Accession XM_114194). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11053. FLJ11539 (Accession NM_024748) is another VGAM2364 host target gene. FLJ11539 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11539 BINDING SITE, designated SEQ ID:24087, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80567] Another function of VGAM2364 is therefore inhibition of FLJ11539 (Accession NM_024748). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ11539. FLJ12505 (Accession NM_024749) is another VGAM2364 host target gene. FLJ12505 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12505 BINDING SITE, designated SEQ ID:24093, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80568] Another function of VGAM2364 is therefore inhibition of FLJ12505 (Accession NM_024749). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12505. FLJ14129 (Accession NM_030895) is another VGAM2364 host target gene. FLJ14129 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14129 BINDING SITE, designated SEQ ID:25163, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM

RNA, also designated SEQ ID:5075.

[80569] Another function of VGAM2364 is therefore inhibition of FLJ14129 (Accession NM_030895). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14129. FLJ20004 (Accession XM_170889) is another VGAM2364 host target gene. FLJ20004 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20004 BINDING SITE, designated SEQ ID:45644, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80570] Another function of VGAM2364 is therefore inhibition of FLJ20004 (Accession XM_170889). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20004. FLJ21709 (Accession XM_085480) is another VGAM2364 host target gene. FLJ21709 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21709, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21709 BINDING SITE, designated SEQ ID:38171, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80571] Another function of VGAM2364 is therefore inhibition of FLJ21709 (Accession XM_085480). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21709. KIAA0084 (Accession XM_042841) is another VGAM2364 host target gene. KIAA0084 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0084 BINDING SITE, designated SEQ ID:33804, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80572] Another function of VGAM2364 is therefore inhibition of KIAA0084 (Accession XM_042841). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0084. KIAA0376 (Accession XM_037759) is another VGAM2364 host target gene. KIAA0376 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0376 BINDING SITE, designated SEQ ID:32673, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80573] Another function of VGAM2364 is therefore inhibition of KIAA0376 (Accession XM_037759). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0376. Kruppel-like Factor 5 (intestinal) (KLF5, Accession NM_001730) is another VGAM2364 host target gene. KLF5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KLF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF5 BINDING SITE, designated SEQ ID:7462,

to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80574] Another function of VGAM2364 is therefore inhibition of Kruppel-like Factor 5 (intestinal) (KLF5, Accession NM_001730). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF5. MGC15631 (Accession NM_032753) is another VGAM2364 host target gene. MGC15631 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC15631, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15631 BINDING SITE, designated SEQ ID:26493, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80575] Another function of VGAM2364 is therefore inhibition of MGC15631 (Accession NM_032753). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15631. MGC20727 (Accession NM_052853) is another VGAM2364 host target gene. MGC20727 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC20727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20727 BINDING SITE, designated SEQ ID:27436, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80576] Another function of VGAM2364 is therefore inhibition of MGC20727 (Accession NM_052853). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20727. MGC2605 (Accession NM_032304) is another VGAM2364 host target gene. MGC2605 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2605, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2605 BINDING SITE, designated SEQ ID:26086, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80577] Another function of VGAM2364 is therefore inhibition of

MGC2605 (Accession NM_032304). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2605. PP1665 (Accession NM_030792) is another VGAM2364 host target gene. PP1665 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PP1665, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1665 BINDING SITE, designated SEQ ID:25090, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80578] Another function of VGAM2364 is therefore inhibition of PP1665 (Accession NM_030792). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1665. Phosphatidylserine Synthase 2 (PTDSS2, Accession NM_030783) is another VGAM2364 host target gene. PTDSS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTDSS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PTDSS2 BINDING SITE, designated SEQ ID:25076, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80579] Another function of VGAM2364 is therefore inhibition of Phosphatidylserine Synthase 2 (PTDSS2, Accession NM_030783). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTDSS2. SAST (Accession XM_032034) is another VGAM2364 host target gene. SAST BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SAST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAST BINDING SITE, designated SEQ ID:31539, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80580] Another function of VGAM2364 is therefore inhibition of SAST (Accession XM_032034). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAST.

SSH2 (Accession XM_030846) is another VGAM2364 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31179, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80581] Another function of VGAM2364 is therefore inhibition of SSH2 (Accession XM_030846). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. U5-116KD (Accession NM_004247) is another VGAM2364 host target gene. U5-116KD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by U5-116KD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of U5-116KD BINDING SITE, designated SEQ ID:10437, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA,

also designated SEQ ID:5075.

[80582] Another function of VGAM2364 is therefore inhibition of U5-116KD (Accession NM_004247). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U5-116KD. LOC130074 (Accession XM_072228) is another VGAM2364 host target gene. LOC130074 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130074 BINDING SITE, designated SEQ ID:37471, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80583] Another function of VGAM2364 is therefore inhibition of LOC130074 (Accession XM_072228). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130074. LOC146506 (Accession XM_085489) is another VGAM2364 host target gene. LOC146506 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146506, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146506 BINDING SITE, designated SEQ ID:38179, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80584] Another function of VGAM2364 is therefore inhibition of LOC146506 (Accession XM_085489). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146506. LOC147229 (Accession XM_085742) is another VGAM2364 host target gene. LOC147229 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147229 BINDING SITE, designated SEQ ID:38317, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80585] Another function of VGAM2364 is therefore inhibition of LOC147229 (Accession XM_085742). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC147229. LOC150244 (Accession XM_086856) is another VGAM2364 host target gene. LOC150244 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150244, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150244 BINDING SITE, designated SEQ ID:38920, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80586] Another function of VGAM2364 is therefore inhibition of LOC150244 (Accession XM_086856). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150244. LOC257426 (Accession XM_039451) is another VGAM2364 host target gene. LOC257426 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257426 BINDING SITE, designated SEQ ID:33099, to

the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80587] Another function of VGAM2364 is therefore inhibition of LOC257426 (Accession XM_039451). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257426. LOC51608 (Accession XM_033102) is another VGAM2364 host target gene. LOC51608 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51608, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51608 BINDING SITE, designated SEQ ID:31840, to the nucleotide sequence of VGAM2364 RNA, herein designated VGAM RNA, also designated SEQ ID:5075.

[80588] Another function of VGAM2364 is therefore inhibition of LOC51608 (Accession XM_033102). Accordingly, utilities of VGAM2364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51608. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2365 (VGAM2365) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80589] VGAM2365 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2365 was detected is described hereinabove with reference to Figs. 1-8.

[80590] VGAM2365 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2365 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80591] VGAM2365 gene encodes a VGAM2365 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2365 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2365 precursor RNA is designated SEQ ID:2351, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2351 is located at position 185947 relative to the genome of Rat Cytomegalovirus.

[80592] VGAM2365 precursor RNA folds onto itself, forming VGAM2365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80593] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2365 folded precursor RNA into VGAM2365 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2365 RNA is designated SEQ ID:5076, and is provided hereinbelow with reference to the sequence listing part.

[80594] VGAM2365 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2365 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2365 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80595] VGAM2365 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2365 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2365 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2365 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2365 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80596] The complementary binding of VGAM2365 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2365 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2365 host target RNA into VGAM2365 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80597] It is appreciated that VGAM2365 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2365 host target genes. The mRNA of each one of this plurality of VGAM2365 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2365 RNA, herein designated VGAM RNA, and which when bound by VGAM2365 RNA causes inhibition of translation of respective one or more VGAM2365 host target proteins.

[80598] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2365 gene, herein designated VGAM GENE, on one or more VGAM2365 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80599] It is yet further appreciated that a function of VGAM2365 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2365 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2365 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80600] Nucleotide sequences of the VGAM2365 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2365 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2365 are further described hereinbelow with reference to Table 1.

[80601] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2365 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2365 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80602] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2365 gene, herein designated VGAM is inhibition of expression of VGAM2365 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2365 correlate with, and may be deduced from, the identity of the target genes which VGAM2365

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80603] Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694) is a VGAM2365 host target gene. PKHD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PKHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKHD1 BINDING SITE, designated SEQ ID:28946, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80604] A function of VGAM2365 is therefore inhibition of Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKHD1. RAD17 Homolog (S. pombe) (RAD17, Accession NM_133340) is another VGAM2365 host target gene. RAD17 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAD17, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD17 BINDING SITE, designated SEQ ID:28482, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80605] Another function of VGAM2365 is therefore inhibition of RAD17 Homolog (S. pombe) (RAD17, Accession NM_133340), a gene which may have a role in DNA damage-dependent and DNA replication-dependent cell cycle checkpoints. Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD17. The function of RAD17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM209.Solute Carrier Family 25 (mitochondrial carrier; ornithine transporter) Member 15 (SLC25A15, Accession NM_014252) is another VGAM2365 host target gene. SLC25A15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC25A15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SLC25A15 BINDING SITE, designated SEQ ID:15524, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80606] Another function of VGAM2365 is therefore inhibition of Solute Carrier Family 25 (mitochondrial carrier; ornithine transporter) Member 15 (SLC25A15, Accession NM_014252), a gene which participates theornithine transport across inner mitochondrial membrane, from the cytoplasm to the matrix. Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A15. The function of SLC25A15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.Solute Carrier Family 38, Member 2 (SLC38A2, Accession NM_018976) is another VGAM2365 host target gene. SLC38A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC38A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SLC38A2 BINDING SITE, designated SEQ ID:21050, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80607] Another function of VGAM2365 is therefore inhibition of Solute Carrier Family 38, Member 2 (SLC38A2, Accession NM_018976), a gene which is an amino acid transporter. Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A2. The function of SLC38A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.ARNTL2 (Accession NM_020183) is another VGAM2365 host target gene. ARNTL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARNTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNTL2 BINDING SITE, designated SEQ ID:21410, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80608] Another function of VGAM2365 is therefore inhibition of ARNTL2 (Accession NM_020183). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNTL2. Chromosome 20 Open Reading Frame 7 (C20orf7, Accession NM_024120) is another VGAM2365 host target gene. C20orf7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf7 BINDING SITE, designated SEQ ID:23572, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80609] Another function of VGAM2365 is therefore inhibition of Chromosome 20 Open Reading Frame 7 (C20orf7, Accession NM_024120). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf7. CDA02 (Accession XM_042168) is another VGAM2365 host target gene. CDA02 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

CDA02, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDA02 BINDING SITE, designated SEQ ID:33702, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80610] Another function of VGAM2365 is therefore inhibition of CDA02 (Accession XM_042168). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDA02. Death-associated Protein Kinase 2 (DAPK2, Accession NM_014326) is another VGAM2365 host target gene. DAPK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAPK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAPK2 BINDING SITE, designated SEQ ID:15637, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80611] Another function of VGAM2365 is therefore inhibition of

Death-associated Protein Kinase 2 (DAPK2, Accession NM_014326). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPK2. DKFZP586I2223 (Accession NM_015438) is another VGAM2365 host target gene. DKFZP586I2223 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586I2223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586I2223 BINDING SITE, designated SEQ ID:17733, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80612] Another function of VGAM2365 is therefore inhibition of DKFZP586I2223 (Accession NM_015438). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586I2223. FLJ10803 (Accession NM_018224) is another VGAM2365 host target gene. FLJ10803 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10803, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10803 BINDING SITE, designated SEQ ID:20157, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80613] Another function of VGAM2365 is therefore inhibition of FLJ10803 (Accession NM_018224). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10803. FLJ13031 (Accession NM_024688) is another VGAM2365 host target gene. FLJ13031 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13031 BINDING SITE, designated SEQ ID:23998, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80614] Another function of VGAM2365 is therefore inhibition of FLJ13031 (Accession NM_024688). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ13031. FLJ32762 (Accession NM_145023) is another VGAM2365 host target gene. FLJ32762 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32762 BINDING SITE, designated SEQ ID:29636, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80615] Another function of VGAM2365 is therefore inhibition of FLJ32762 (Accession NM_145023). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32762. KIAA1946 (Accession XM_092459) is another VGAM2365 host target gene. KIAA1946 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1946 BINDING SITE, designated SEQ ID:40119, to the nucleotide sequence of VGAM2365 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5076.

[80616] Another function of VGAM2365 is therefore inhibition of KIAA1946 (Accession XM_092459). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1946. MGC16142 (Accession NM_032763) is another VGAM2365 host target gene. MGC16142 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC16142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16142 BINDING SITE, designated SEQ ID:26508, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80617] Another function of VGAM2365 is therefore inhibition of MGC16142 (Accession NM_032763). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16142. Nuclear Receptor Coactivator 2 (NCOA2, Accession NM_006540) is another VGAM2365 host target gene. NCOA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

NCOA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA2 BINDING SITE, designated SEQ ID:13297, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80618] Another function of VGAM2365 is therefore inhibition of Nuclear Receptor Coactivator 2 (NCOA2, Accession NM_006540). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA2. Signal Sequence Receptor, Alpha (translocon-associated protein alpha) (SSR1, Accession NM_003144) is another VGAM2365 host target gene. SSR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR1 BINDING SITE, designated SEQ ID:9114, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80619] Another function of VGAM2365 is therefore inhibition of

Signal Sequence Receptor, Alpha (translocon-associated protein alpha) (SSR1, Accession NM_003144). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSR1. Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872) is another VGAM2365 host target gene. UNC5D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UNC5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5D BINDING SITE, designated SEQ ID:28114, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80620] Another function of VGAM2365 is therefore inhibition of Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5D. LOC203369 (Accession XM_114689) is another VGAM2365 host target gene. LOC203369 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by LOC203369, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203369 BINDING SITE, designated SEQ ID:43033, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80621] Another function of VGAM2365 is therefore inhibition of LOC203369 (Accession XM_114689). Accordingly, utilities of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203369. LOC206480 (Accession XM_121360) is another VGAM2365 host target gene. LOC206480 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC206480, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206480 BINDING SITE, designated SEQ ID:43614, to the nucleotide sequence of VGAM2365 RNA, herein designated VGAM RNA, also designated SEQ ID:5076.

[80622] Another function of VGAM2365 is therefore inhibition of LOC206480 (Accession XM_121360). Accordingly, utilities

of VGAM2365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206480. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2366 (VGAM2366) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80623] VGAM2366 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2366 was detected is described hereinabove with reference to Figs. 1-8.

[80624] VGAM2366 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2366 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80625] VGAM2366 gene encodes a VGAM2366 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2366 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2366 precursor RNA is designated SEQ ID:2352, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2352 is located at position 183326 relative to the genome of Rat Cytomegalovirus.

[80626] VGAM2366 precursor RNA folds onto itself, forming VGAM2366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80627] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2366 folded precursor RNA into VGAM2366 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2366 RNA is designated SEQ ID:5077, and

is provided hereinbelow with reference to the sequence listing part.

[80628] VGAM2366 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2366 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2366 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80629] VGAM2366 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2366 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2366 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2366 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2366 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80630] The complementary binding of VGAM2366 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2366 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2366 host target RNA into VGAM2366 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80631] It is appreciated that VGAM2366 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2366 host target genes. The mRNA of each one of this plurality of VGAM2366 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2366 RNA, herein designated VGAM RNA, and which when bound by VGAM2366 RNA causes inhibition of translation of respective one or more VGAM2366 host target proteins.

[80632] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2366 gene, herein designated VGAM GENE, on one or more VGAM2366 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80633] It is yet further appreciated that a function of VGAM2366 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2366 correlate with, and may be deduced from, the identity of the host target genes which VGAM2366 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80634] Nucleotide sequences of the VGAM2366 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2366 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2366 are further described hereinbelow with reference to Table 1.

[80635] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2366 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2366 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80636] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2366 gene, herein designated VGAM is inhibition of expression of VGAM2366 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2366 correlate with, and may be deduced from, the identity of the target genes which VGAM2366 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80637] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 5 (ABCC5, Accession NM_005688) is a VGAM2366 host target gene. ABCC5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC5 BINDING SITE, designated SEQ ID:12248, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80638] A function of VGAM2366 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 5 (ABCC5, Accession NM_005688), a gene which acts as a multispecific organic anion pump which can transport nucleotide analogs. Accordingly, utilities of VGAM2366 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC5. The function of ABCC5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1744.ADP-ribosyltransferase (NAD+; poly (ADP-ribose) Polymerase) (ADPRT, Accession NM_001618) is another VGAM2366 host target gene. ADPRT BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ADPRT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADPRT BINDING SITE, designated SEQ ID:7324, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80639] Another function of VGAM2366 is therefore inhibition of ADP-ribosyltransferase (NAD+; poly (ADP-ribose) Polymerase) (ADPRT, Accession NM_001618), a gene which catalyzes addition of mono-ADP-ribose to arginine residues of proteins, inhibits Pol II transcription. Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with ADPRT. The function of ADPRT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM506.Insulin Receptor Substrate 2 (IRS2, Accession XM_007095) is another VGAM2366 host target gene. IRS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IRS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRS2 BINDING SITE, designated SEQ ID:30029, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80640] Another function of VGAM2366 is therefore inhibition of Insulin Receptor Substrate 2 (IRS2, Accession XM_007095), a gene which may mediate the control of various cellular processes by insulin. Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRS2. The function of IRS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM1217.Neuropeptide Y Receptor Y2 (NPY2R, Accession NM_000910) is another VGAM2366 host target gene. NPY2R BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NPY2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPY2R BINDING SITE, designated SEQ ID:6612, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80641] Another function of VGAM2366 is therefore inhibition of Neuropeptide Y Receptor Y2 (NPY2R, Accession NM_000910), a gene which stimulates intracellular calcium flux and may modulate psychomotor activity, food intake, endocrine secretion and vasoconstriction. Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPY2R. The function of NPY2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309.Prominin-like 1 (mouse) (PROML1, Accession NM_006017) is another

VGAM2366 host target gene. PROML1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PROML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROML1 BINDING SITE, designated SEQ ID:12635, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80642] Another function of VGAM2366 is therefore inhibition of Prominin-like 1 (mouse) (PROML1, Accession NM_006017), a gene which is a Transmembrane protein. Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROML1. The function of PROML1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM905.Transmembrane Protein 2 (TMEM2, Accession NM_013390) is another VGAM2366 host target gene. TMEM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TMEM2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEM2 BINDING SITE, designated SEQ ID:15042, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80643] Another function of VGAM2366 is therefore inhibition of Transmembrane Protein 2 (TMEM2, Accession NM_013390). Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEM2. FLJ13491 (Accession NM_024623) is another VGAM2366 host target gene. FLJ13491 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13491, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13491 BINDING SITE, designated SEQ ID:23888, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80644] Another function of VGAM2366 is therefore inhibition of FLJ13491 (Accession NM_024623). Accordingly, utilities of

VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13491. KIAA0125 (Accession XM_018203) is another VGAM2366 host target gene. KIAA0125 BINDING SITE1 and KIAA0125 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0125, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0125 BINDING SITE1 and KIAA0125 BINDING SITE2, designated SEQ ID:30347 and SEQ ID:16692 respectively, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80645] Another function of VGAM2366 is therefore inhibition of KIAA0125 (Accession XM_018203). Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0125. KIAA0469 (Accession NM_014851) is another VGAM2366 host target gene. KIAA0469 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0469, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:16890, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80646] Another function of VGAM2366 is therefore inhibition of KIAA0469 (Accession NM_014851). Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469. KIAA1005 (Accession XM_051197) is another VGAM2366 host target gene. KIAA1005 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1005, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1005 BINDING SITE, designated SEQ ID:35778, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80647] Another function of VGAM2366 is therefore inhibition of KIAA1005 (Accession XM_051197). Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1005. PP1628 (Accession NM_025201) is another VGAM2366 host target gene. PP1628 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PP1628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1628 BINDING SITE, designated SEQ ID:24858, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80648] Another function of VGAM2366 is therefore inhibition of PP1628 (Accession NM_025201). Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1628. Thioesterase, Adipose Associated (THEA, Accession XM_038922) is another VGAM2366 host target gene. THEA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by THEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THEA BINDING SITE, designated SEQ ID:32952, to the nucleotide sequence of VGAM2366 RNA, herein

designated VGAM RNA, also designated SEQ ID:5077.

[80649] Another function of VGAM2366 is therefore inhibition of Thioesterase, Adipose Associated (THEA, Accession XM_038922). Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THEA. LOC128338 (Accession XM_059238) is another VGAM2366 host target gene. LOC128338 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC128338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128338 BINDING SITE, designated SEQ ID:36927, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80650] Another function of VGAM2366 is therefore inhibition of LOC128338 (Accession XM_059238). Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128338. LOC146713 (Accession XM_097071) is another VGAM2366 host target gene. LOC146713 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC146713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146713 BINDING SITE, designated SEQ ID:40714, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80651] Another function of VGAM2366 is therefore inhibition of LOC146713 (Accession XM_097071). Accordingly, utilities of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146713. LOC220070 (Accession NM_145308) is another VGAM2366 host target gene. LOC220070 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220070 BINDING SITE, designated SEQ ID:29820, to the nucleotide sequence of VGAM2366 RNA, herein designated VGAM RNA, also designated SEQ ID:5077.

[80652] Another function of VGAM2366 is therefore inhibition of LOC220070 (Accession NM_145308). Accordingly, utilities

of VGAM2366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220070. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2367 (VGAM2367) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80653] VGAM2367 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2367 was detected is described hereinabove with reference to Figs. 1-8.

[80654] VGAM2367 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2367 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80655] VGAM2367 gene encodes a VGAM2367 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2367 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2367 precursor RNA is designated SEQ ID:2353, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2353 is located at position 207957 relative to the genome of Rat Cytomegalovirus.

[80656] VGAM2367 precursor RNA folds onto itself, forming VGAM2367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80657] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2367 folded precursor RNA into VGAM2367 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2367 RNA is designated SEQ ID:5078, and

is provided hereinbelow with reference to the sequence listing part.

[80658] VGAM2367 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2367 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2367 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80659] VGAM2367 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2367 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2367 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2367 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2367 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80660] The complementary binding of VGAM2367 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2367 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2367 host target RNA into VGAM2367 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80661] It is appreciated that VGAM2367 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2367 host target genes. The mRNA of each one of this plurality of VGAM2367 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2367 RNA, herein designated VGAM RNA, and which when bound by VGAM2367 RNA causes inhibition of translation of respective one or more VGAM2367 host target proteins.

[80662] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2367 gene, herein designated VGAM GENE, on one or more VGAM2367 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80663] It is yet further appreciated that a function of VGAM2367 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2367 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2367 correlate with, and may be deduced from, the identity of the host target genes which VGAM2367 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80664] Nucleotide sequences of the VGAM2367 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2367 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2367 are further described hereinbelow with reference to Table 1.

[80665] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2367 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2367 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80666] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2367 gene, herein designated VGAM is inhibition of expression of VGAM2367 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2367 correlate with, and may be deduced from, the identity of the target genes which VGAM2367 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80667] A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM_007203) is a VGAM2367 host target gene. AKAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP2 BINDING SITE, designated SEQ ID:14058, to the nucleotide sequence of VGAM2367 RNA, herein designated VGAM RNA, also designated SEQ ID:5078.

[80668] A function of VGAM2367 is therefore inhibition of A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM_007203), a gene which binds to regulatory subunit (rii) of protein kinase a. Accordingly, utilities of VGAM2367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP2.

The function of AKAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2368 (VGAM2368) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80669] VGAM2368 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2368 was detected is described hereinabove with reference to Figs. 1-8.

[80670] VGAM2368 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2368 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80671] VGAM2368 gene encodes a VGAM2368 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2368 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2368 precursor RNA is designated SEQ ID:2354, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2354 is located at position 223088 relative to the genome of Rat Cytomegalovirus.

[80672] VGAM2368 precursor RNA folds onto itself, forming VGAM2368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80673] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2368 folded precursor RNA into VGAM2368 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM2368 RNA is designated SEQ ID:5079, and is provided hereinbelow with reference to the sequence listing part.

[80674] VGAM2368 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2368 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2368 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80675] VGAM2368 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2368 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2368 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2368 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2368 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80676] The complementary binding of VGAM2368 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2368 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2368 host target RNA into VGAM2368 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80677] It is appreciated that VGAM2368 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2368 host target genes. The mRNA of each one of this plurality of VGAM2368 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2368 RNA, herein designated VGAM RNA, and which when bound by VGAM2368 RNA causes inhibition of translation of respective one or more VGAM2368 host target proteins.

[80678] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2368 gene, herein designated VGAM GENE, on one or more VGAM2368 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80679] It is yet further appreciated that a function of VGAM2368

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2368 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2368 correlate with, and may be deduced from, the identity of the host target genes which VGAM2368 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80680] Nucleotide sequences of the VGAM2368 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2368 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2368 are further described hereinbelow with reference to Table 1.

[80681] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2368 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2368 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80682] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2368 gene, herein designated VGAM is inhibition of expression of VGAM2368 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2368 correlate with, and may be deduced from, the identity of the target genes which VGAM2368 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80683] Apolipoprotein L, 6 (APOL6, Accession NM_030641) is a VGAM2368 host target gene. APOL6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by APOL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL6 BINDING SITE, designated SEQ ID:24968, to the nucleotide sequence of VGAM2368 RNA, herein designated VGAM RNA, also designated SEQ ID:5079.

[80684] A function of VGAM2368 is therefore inhibition of Apolipoprotein L, 6 (APOL6, Accession NM_030641). Accordingly, utilities of VGAM2368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL6. Fig. 1 further provides a concep-

tual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2369 (VGAM2369) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80685] VGAM2369 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2369 was detected is described hereinabove with reference to Figs. 1-8.

[80686] VGAM2369 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2369 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80687] VGAM2369 gene encodes a VGAM2369 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2369 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2369 precursor RNA is designated SEQ ID:2355, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2355 is located at position 208920 relative to the genome of Rat Cytomegalovirus.

[80688] VGAM2369 precursor RNA folds onto itself, forming VGAM2369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80689] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2369 folded precursor RNA into VGAM2369 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2369 RNA is designated SEQ ID:5080, and is provided hereinbelow with reference to the sequence listing part.

[80690] VGAM2369 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2369 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2369 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80691] VGAM2369 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2369 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2369 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2369 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2369 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80692] The complementary binding of VGAM2369 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2369 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2369 host target RNA into VGAM2369 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80693] It is appreciated that VGAM2369 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2369 host target genes. The mRNA of each one of this plurality of VGAM2369 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2369 RNA, herein designated VGAM RNA, and which when bound by VGAM2369 RNA causes inhibition of translation of respective one or more

VGAM2369 host target proteins.

[80694] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2369 gene, herein designated VGAM GENE, on one or more VGAM2369 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80695] It is yet further appreciated that a function of VGAM2369 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Spe-

cific functions, and accordingly utilities, of VGAM2369 correlate with, and may be deduced from, the identity of the host target genes which VGAM2369 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80696] Nucleotide sequences of the VGAM2369 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2369 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2369 are further described hereinbelow with reference to Table 1.

[80697] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2369 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2369 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80698] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2369 gene, herein designated VGAM is inhibition of expression of VGAM2369 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2369 correlate with, and may be deduced from, the identity of the target genes which VGAM2369 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80699] Numb Homolog (Drosophila) (NUMB, Accession NM_003744) is a VGAM2369 host target gene. NUMB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUMB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUMB BINDING SITE, designated SEQ ID:9831, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80700] A function of VGAM2369 is therefore inhibition of Numb Homolog (Drosophila) (NUMB, Accession NM_003744), a gene which may act in generating asymmetric cell division during neurogenesisand is strongly similar to murine Numb. Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUMB. The function of NUMB and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM2322.Protocadherin Alpha 1 (PCDHA1, Accession NM_018900) is another VGAM2369 host target gene. PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2, designated SEQ ID:20860 and SEQ ID:25379 respectively, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80701] Another function of VGAM2369 is therefore inhibition of Protocadherin Alpha 1 (PCDHA1, Accession NM_018900). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA1. Protocadherin Alpha 10 (PCDHA10, Accession NM_018901) is another VGAM2369 host target gene. PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA10, corresponding to HOST TARGET binding sites such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2, designated SEQ ID:20870 and SEQ ID:20880 respectively, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80702] Another function of VGAM2369 is therefore inhibition of Protocadherin Alpha 10 (PCDHA10, Accession NM_018901). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA10. Protocadherin Alpha 13 (PCDHA13, Accession NM_018904) is another VGAM2369 host target gene. PCDHA13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHA13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA13 BINDING SITE, designated SEQ ID:20901, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80703] Another function of VGAM2369 is therefore inhibition of Protocadherin Alpha 13 (PCDHA13, Accession

NM_018904). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA13. Protocadherin Alpha 2 (PCDHA2, Accession NM_018905) is another VGAM2369 host target gene. PCDHA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA2 BINDING SITE, designated SEQ ID:20911, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80704] Another function of VGAM2369 is therefore inhibition of Protocadherin Alpha 2 (PCDHA2, Accession NM_018905). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA2. Protocadherin Alpha 3 (PCDHA3, Accession NM_018906) is another VGAM2369 host target gene. PCDHA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA3 BINDING SITE, designated SEQ ID:20921, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80705] Another function of VGAM2369 is therefore inhibition of Protocadherin Alpha 3 (PCDHA3, Accession NM_018906). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA3. Protocadherin Alpha 4 (PCDHA4, Accession NM_018907) is another VGAM2369 host target gene. PCDHA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA4 BINDING SITE, designated SEQ ID:20931, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80706] Another function of VGAM2369 is therefore inhibition of Protocadherin Alpha 4 (PCDHA4, Accession NM_018907). Accordingly, utilities of VGAM2369 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with PCDHA4. Protocadherin Alpha 5 (PCDHA5, Accession NM_018908) is another VGAM2369 host target gene. PCDHA5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA5 BINDING SITE, designated SEQ ID:20941, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80707] Another function of VGAM2369 is therefore inhibition of Protocadherin Alpha 5 (PCDHA5, Accession NM_018908). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA5. Protocadherin Alpha 6 (PCDHA6, Accession NM_018909) is another VGAM2369 host target gene. PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2, designated SEQ ID:20951 and SEQ ID:25583 respectively, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80708] Another function of VGAM2369 is therefore inhibition of Protocadherin Alpha 6 (PCDHA6, Accession NM_018909). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA6. Protocadherin Alpha 8 (PCDHA8, Accession NM_018911) is another VGAM2369 host target gene. PCDHA8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA8 BINDING SITE, designated SEQ ID:20971, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80709] Another function of VGAM2369 is therefore inhibition of Protocadherin Alpha 8 (PCDHA8, Accession NM_018911). Accordingly, utilities of VGAM2369 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with PCDHA8. Protocadherin Alpha 9 (PCDHA9, Accession NM_031857) is another VGAM2369 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:25596, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80710] Another function of VGAM2369 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_031857), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71.Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898) is another VGAM2369 host target

gene. PCDHAC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC1 BINDING SITE, designated SEQ ID:20840, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80711] Another function of VGAM2369 is therefore inhibition of Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC1. Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM_018899) is another VGAM2369 host target gene. PCDHAC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHAC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC2 BINDING SITE, designated SEQ ID:20850, to the nucleotide sequence of VGAM2369 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5080.

[80712] Another function of VGAM2369 is therefore inhibition of Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM_018899). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC2. FHR5 (Accession NM_030787) is another VGAM2369 host target gene. FHR5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FHR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHR5 BINDING SITE, designated SEQ ID:25082, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80713] Another function of VGAM2369 is therefore inhibition of FHR5 (Accession NM_030787). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHR5. FLJ10511 (Accession NM_018120) is another VGAM2369 host target gene. FLJ10511 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10511, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10511 BINDING SITE, designated SEQ ID:19897, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80714] Another function of VGAM2369 is therefore inhibition of FLJ10511 (Accession NM_018120). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10511. FLJ13962 (Accession NM_024862) is another VGAM2369 host target gene. FLJ13962 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13962 BINDING SITE, designated SEQ ID:24296, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80715] Another function of VGAM2369 is therefore inhibition of FLJ13962 (Accession NM_024862). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13962. LOC143785 (Accession XM_084635) is another VGAM2369 host target gene. LOC143785 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143785, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143785 BINDING SITE, designated SEQ ID:37631, to the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80716] Another function of VGAM2369 is therefore inhibition of LOC143785 (Accession XM_084635). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143785. LOC152215 (Accession XM_087407) is another VGAM2369 host target gene. LOC152215 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152215 BINDING SITE, designated SEQ ID:39224, to

the nucleotide sequence of VGAM2369 RNA, herein designated VGAM RNA, also designated SEQ ID:5080.

[80717] Another function of VGAM2369 is therefore inhibition of LOC152215 (Accession XM_087407). Accordingly, utilities of VGAM2369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152215. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2370 (VGAM2370) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80718] VGAM2370 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2370 was detected is described hereinabove with reference to Figs. 1-8.

[80719] VGAM2370 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2370 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80720] VGAM2370 gene encodes a VGAM2370 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2370 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2370 precursor RNA is designated SEQ ID:2356, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2356 is located at position 217655 relative to the genome of Rat Cytomegalovirus.

[80721] VGAM2370 precursor RNA folds onto itself, forming VGAM2370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80722] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2370 folded precursor RNA into VGAM2370 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2370 RNA is designated SEQ ID:5081, and is provided hereinbelow with reference to the sequence listing part.

[80723] VGAM2370 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2370 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2370 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80724] VGAM2370 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2370 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2370 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2370 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2370 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80725] The complementary binding of VGAM2370 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2370 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2370 host target RNA into VGAM2370 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80726] It is appreciated that VGAM2370 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2370 host target genes. The mRNA of each one of this plurality of VGAM2370 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2370 RNA, herein designated VGAM RNA, and which when bound by VGAM2370 RNA causes inhibition of translation of respective one or more VGAM2370 host target proteins.

[80727] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2370 gene, herein designated VGAM GENE, on one or more VGAM2370 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80728] It is yet further appreciated that a function of VGAM2370 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2370 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2370 correlate with, and may be deduced from, the identity of the host target genes which VGAM2370 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80729] Nucleotide sequences of the VGAM2370 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2370 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2370 are further described hereinbelow with reference to Table 1.

[80730] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2370 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2370 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80731] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2370 gene, herein designated VGAM is inhibition of expression of VGAM2370 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2370 correlate with, and may be deduced from, the identity of the target genes which VGAM2370 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80732] Collagen, Type IV, Alpha 1 (COL4A1, Accession NM_001845) is a VGAM2370 host target gene. COL4A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A1 BINDING SITE, designated SEQ ID:7580, to the nucleotide sequence of VGAM2370 RNA, herein designated VGAM RNA, also designated SEQ ID:5081.

[80733] A function of VGAM2370 is therefore inhibition of Colla-

gen, Type IV, Alpha 1 (COL4A1, Accession NM_001845), a gene which is a member of a subfamily of collagen extracellular matrix proteins. Accordingly, utilities of VGAM2370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A1. The function of COL4A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1645.Catenin (cadherin-associated protein), Alpha 2 (CTNNA2, Accession NM_004389) is another VGAM2370 host target gene. CTNNA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTNNA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNNA2 BINDING SITE, designated SEQ ID:10617, to the nucleotide sequence of VGAM2370 RNA, herein designated VGAM RNA, also designated SEQ ID:5081.

[80734] Another function of VGAM2370 is therefore inhibition of Catenin (cadherin-associated protein), Alpha 2 (CTNNA2, Accession NM_004389), a gene which is involved in the cytoplasmic anchorage of cell-cell and cell-substrate ad-

hesion molecules. Accordingly, utilities of VGAM2370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNNA2. The function of CTNNA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM877.Catenin (cadherin-associated protein), Delta 2 (neural plakophilin-related arm-repeat protein) (CTNND2, Accession NM_001332) is another VGAM2370 host target gene. CTNND2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTNND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNND2 BINDING SITE, designated SEQ ID:7015, to the nucleotide sequence of VGAM2370 RNA, herein designated VGAM RNA, also designated SEQ ID:5081.

[80735] Another function of VGAM2370 is therefore inhibition of Catenin (cadherin-associated protein), Delta 2 (neural plakophilin-related arm-repeat protein) (CTNND2, Accession NM_001332), a gene which interacts with presenilin 1 (PSEN1) and is a member of the plakoglobin/armadillo

family. Accordingly, utilities of VGAM2370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNND2. The function of CTNND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2235.FKSG28 (Accession NM_030929) is another VGAM2370 host target gene. FKSG28 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKSG28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKSG28 BINDING SITE, designated SEQ ID:25201, to the nucleotide sequence of VGAM2370 RNA, herein designated VGAM RNA, also designated SEQ ID:5081.

[80736] Another function of VGAM2370 is therefore inhibition of FKSG28 (Accession NM_030929). Accordingly, utilities of VGAM2370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKSG28. Myristoylated Alanine-rich Protein Kinase C Substrate (MARCKS, Accession NM_002356) is another VGAM2370 host target gene. MARCKS BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MARCKS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MARCKS BINDING SITE, designated SEQ ID:8169, to the nucleotide sequence of VGAM2370 RNA, herein designated VGAM RNA, also designated SEQ ID:5081.

[80737] Another function of VGAM2370 is therefore inhibition of Myristoylated Alanine-rich Protein Kinase C Substrate (MARCKS, Accession NM_002356). Accordingly, utilities of VGAM2370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARCKS. NPD009 (Accession XM_170795) is another VGAM2370 host target gene. NPD009 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NPD009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPD009 BINDING SITE, designated SEQ ID:45565, to the nucleotide sequence of VGAM2370 RNA, herein designated VGAM RNA, also designated SEQ ID:5081.

[80738] Another function of VGAM2370 is therefore inhibition of NPD009 (Accession XM_170795). Accordingly, utilities of VGAM2370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPD009. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2371 (VGAM2371) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80739] VGAM2371 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2371 was detected is described hereinabove with reference to Figs. 1-8.

[80740] VGAM2371 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2371 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80741] VGAM2371 gene encodes a VGAM2371 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2371 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2371 precursor RNA is designated SEQ ID:2357, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2357 is located at position 183987 relative to the genome of Rat Cytomegalovirus.

[80742] VGAM2371 precursor RNA folds onto itself, forming VGAM2371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80743] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2371 folded precursor RNA into VGAM2371 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 60%) nucleotide sequence of VGAM2371 RNA is designated SEQ ID:5082, and is provided hereinbelow with reference to the sequence listing part.

[80744] VGAM2371 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2371 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2371 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80745] VGAM2371 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2371 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2371 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2371 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2371 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80746] The complementary binding of VGAM2371 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2371 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2371 host target RNA into VGAM2371 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80747] It is appreciated that VGAM2371 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2371 host target genes. The mRNA of each one of this plurality of VGAM2371 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2371 RNA, herein designated VGAM RNA, and which when bound by VGAM2371 RNA causes inhibition of translation of respective one or more VGAM2371 host target proteins.

[80748] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2371 gene, herein designated VGAM GENE, on one or more VGAM2371 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80749] It is yet further appreciated that a function of VGAM2371 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2371 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2371 correlate with, and may be deduced from, the identity of the host target genes which VGAM2371 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80750] Nucleotide sequences of the VGAM2371 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2371 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2371 are further described hereinbelow with reference to Table 1.

[80751] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2371 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2371 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[80752] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2371 gene, herein designated VGAM is inhibition of expression of VGAM2371 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2371 correlate with, and may be deduced from, the identity of the target genes which VGAM2371 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80753] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 1 (B4GALT1, Accession NM_001497) is a VGAM2371 host target gene. B4GALT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by B4GALT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT1 BINDING SITE, designated SEQ ID:7246, to the nucleotide sequence of VGAM2371 RNA, herein designated VGAM RNA, also designated SEQ ID:5082.

[80754] A function of VGAM2371 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 1 (B4GALT1, Accession NM_001497). Accordingly,

utilities of VGAM2371 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT1. IRTA2 (Accession NM_031281) is another VGAM2371 host target gene. IRTA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IRTA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRTA2 BINDING SITE, designated SEQ ID:25299, to the nucleotide sequence of VGAM2371 RNA, herein designated VGAM RNA, also designated SEQ ID:5082.

[80755] Another function of VGAM2371 is therefore inhibition of IRTA2 (Accession NM_031281), a gene which binds to the fc region of immunoglobulins gamma low affinity receptor. Accordingly, utilities of VGAM2371 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRTA2. The function of IRTA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.KIAA1318 (Accession XM_041080) is another VGAM2371 host target gene. KIAA1318 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by KIAA1318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1318 BINDING SITE, designated SEQ ID:33433, to the nucleotide sequence of VGAM2371 RNA, herein designated VGAM RNA, also designated SEQ ID:5082.

[80756] Another function of VGAM2371 is therefore inhibition of KIAA1318 (Accession XM_041080). Accordingly, utilities of VGAM2371 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1318. MOST2 (Accession NM_020250) is another VGAM2371 host target gene. MOST2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MOST2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOST2 BINDING SITE, designated SEQ ID:21554, to the nucleotide sequence of VGAM2371 RNA, herein designated VGAM RNA, also designated SEQ ID:5082.

[80757] Another function of VGAM2371 is therefore inhibition of

MOST2 (Accession NM_020250). Accordingly, utilities of VGAM2371 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOST2. LOC158364 (Accession XM_088546) is another VGAM2371 host target gene. LOC158364 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158364 BINDING SITE, designated SEQ ID:39818, to the nucleotide sequence of VGAM2371 RNA, herein designated VGAM RNA, also designated SEQ ID:5082.

[80758] Another function of VGAM2371 is therefore inhibition of LOC158364 (Accession XM_088546). Accordingly, utilities of VGAM2371 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158364. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2372 (VGAM2372) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[80759] VGAM2372 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2372 was detected is described hereinabove with reference to Figs. 1-8.

[80760] VGAM2372 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2372 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80761] VGAM2372 gene encodes a VGAM2372 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2372 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2372 precursor RNA is designated SEQ ID:2358, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2358 is located at position 208652 relative to the genome of Rat Cytomegalovirus.

[80762] VGAM2372 precursor RNA folds onto itself, forming VGAM2372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80763] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2372 folded precursor RNA into VGAM2372 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2372 RNA is designated SEQ ID:5083, and is provided hereinbelow with reference to the sequence listing part.

[80764] VGAM2372 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2372 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2372 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80765] VGAM2372 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2372 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2372 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2372 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2372 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[80766] The complementary binding of VGAM2372 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2372 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2372 host target RNA into VGAM2372 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80767] It is appreciated that VGAM2372 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2372 host target genes. The mRNA of each one of this plurality of VGAM2372 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2372 RNA, herein designated VGAM RNA, and which when bound by VGAM2372 RNA causes inhibition of translation of respective one or more VGAM2372 host target proteins.

[80768] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2372 gene, herein designated VGAM GENE, on one

or more VGAM2372 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80769] It is yet further appreciated that a function of VGAM2372 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2372 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2372 correlate with, and may be deduced from, the identity of the host target genes which VGAM2372 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80770] Nucleotide sequences of the VGAM2372 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2372 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2372 are further described hereinbelow with reference to Table 1.

[80771] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2372 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2372 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80772] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2372 gene, herein designated VGAM is inhibition of expression of VGAM2372 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2372 correlate with, and may be deduced from, the identity of the target genes which VGAM2372 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80773] Dystrophin (muscular dystrophy, Duchenne and Becker

types) (DMD, Accession NM_000109) is a VGAM2372 host target gene. DMD BINDING SITE1 through DMD BINDING SITE13 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 through DMD BINDING SITE13, designated SEQ ID:5573, SEQ ID:10156, SEQ ID:10163, SEQ ID:10209, SEQ ID:10214, SEQ ID:10225, SEQ ID:10169, SEQ ID:10177, SEQ ID:10182, SEQ ID:10187, SEQ ID:10198, SEQ ID:10204 and SEQ ID:10237 respectively, to the nucleotide sequence of VGAM2372 RNA, herein designated VGAM RNA, also designated SEQ ID:5083.

[80774] A function of VGAM2372 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM_000109), a gene which muscular dystrophy . Accordingly, utilities of VGAM2372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM218.Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_000793) is another VGAM2372 host target gene. DIO2 BINDING SITE1 and DIO2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DIO2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE1 and DIO2 BINDING SITE2, designated SEQ ID:6462 and SEQ ID:15173 respectively, to the nucleotide sequence of VGAM2372 RNA, herein designated VGAM RNA, also designated SEQ ID:5083.

[80775] Another function of VGAM2372 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_000793). Accordingly, utilities of VGAM2372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. FLJ14906 (Accession NM_032859) is another VGAM2372 host target gene. FLJ14906 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of FLJ14906 BINDING SITE, designated SEQ ID:26661, to the nucleotide sequence of VGAM2372 RNA, herein designated VGAM RNA, also designated SEQ ID:5083.

[80776] Another function of VGAM2372 is therefore inhibition of FLJ14906 (Accession NM_032859). Accordingly, utilities of VGAM2372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14906. PRO1584 (Accession NM_018586) is another VGAM2372 host target gene. PRO1584 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1584 BINDING SITE, designated SEQ ID:20662, to the nucleotide sequence of VGAM2372 RNA, herein designated VGAM RNA, also designated SEQ ID:5083.

[80777] Another function of VGAM2372 is therefore inhibition of PRO1584 (Accession NM_018586). Accordingly, utilities of VGAM2372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1584. LOC203078 (Accession XM_114625) is another

VGAM2372 host target gene. LOC203078 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203078 BINDING SITE, designated SEQ ID:43006, to the nucleotide sequence of VGAM2372 RNA, herein designated VGAM RNA, also designated SEQ ID:5083.

[80778] Another function of VGAM2372 is therefore inhibition of LOC203078 (Accession XM_114625). Accordingly, utilities of VGAM2372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203078. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2373 (VGAM2373) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80779] VGAM2373 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2373 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[80780] VGAM2373 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2373 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80781] VGAM2373 gene encodes a VGAM2373 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2373 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2373 precursor RNA is designated SEQ ID:2359, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2359 is located at position 222910 relative to the genome of Rat Cytomegalovirus.

[80782] VGAM2373 precursor RNA folds onto itself, forming VGAM2373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80783] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2373 folded precursor RNA into VGAM2373 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2373 RNA is designated SEQ ID:5084, and is provided hereinbelow with reference to the sequence listing part.

[80784] VGAM2373 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2373 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2373 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80785] VGAM2373 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2373 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2373 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2373 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2373 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80786] The complementary binding of VGAM2373 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2373 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2373 host target RNA into VGAM2373 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80787] It is appreciated that VGAM2373 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2373 host target genes. The mRNA of each one of this plurality of VGAM2373 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2373 RNA, herein designated VGAM RNA, and which when bound by VGAM2373 RNA causes inhibition of translation of respective one or more VGAM2373 host target proteins.

[80788] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2373 gene, herein designated VGAM GENE, on one or more VGAM2373 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80789] It is yet further appreciated that a function of VGAM2373 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2373 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2373 correlate with, and may be deduced from, the identity of the host target genes which VGAM2373 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80790] Nucleotide sequences of the VGAM2373 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2373 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2373 are further described hereinbelow with reference to Table 1.

[80791] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2373 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2373 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80792] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2373 gene, herein designated VGAM is inhibition of expression of VGAM2373 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2373 correlate with, and may be deduced from, the identity of the target genes which VGAM2373 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80793] LIM Domain Kinase 1 (LIMK1, Accession NM_002314) is a VGAM2373 host target gene. LIMK1 BINDING SITE1 and LIMK1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LIMK1, corresponding to HOST TARGET binding sites such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK1 BINDING SITE1 and LIMK1 BINDING SITE2, designated SEQ ID:8127 and SEQ ID:18804 respectively, to the nucleotide sequence of VGAM2373 RNA, herein designated VGAM RNA, also designated SEQ ID:5084.

[80794] A function of VGAM2373 is therefore inhibition of LIM Domain Kinase 1 (LIMK1, Accession NM_002314). Accordingly, utilities of VGAM2373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2374 (VGAM2374) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80795] VGAM2374 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2374 was detected is described hereinabove with reference to Figs. 1-8.

[80796] VGAM2374 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Rat Cytomegalovirus. VGAM2374 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80797] VGAM2374 gene encodes a VGAM2374 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2374 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2374 precursor RNA is designated SEQ ID:2360, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2360 is located at position 203878 relative to the genome of Rat Cytomegalovirus.

[80798] VGAM2374 precursor RNA folds onto itself, forming VGAM2374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80799] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2374 folded precursor RNA into VGAM2374 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM2374 RNA is designated SEQ ID:5085, and is provided hereinbelow with reference to the sequence listing part.

[80800] VGAM2374 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2374 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2374 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80801] VGAM2374 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2374 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2374 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2374 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2374 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80802] The complementary binding of VGAM2374 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2374 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2374

host target RNA into VGAM2374 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80803] It is appreciated that VGAM2374 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2374 host target genes. The mRNA of each one of this plurality of VGAM2374 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2374 RNA, herein designated VGAM RNA, and which when bound by VGAM2374 RNA causes inhibition of translation of respective one or more VGAM2374 host target proteins.

[80804] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2374 gene, herein designated VGAM GENE, on one or more VGAM2374 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80805] It is yet further appreciated that a function of VGAM2374 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2374 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2374 correlate with, and may be deduced from, the identity of the host target genes which VGAM2374 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80806] Nucleotide sequences of the VGAM2374 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2374 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2374 are further

described hereinbelow with reference to Table 1.

[80807] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2374 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2374 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80808] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2374 gene, herein designated VGAM is inhibition of expression of VGAM2374 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2374 correlate with, and may be deduced from, the identity of the target genes which VGAM2374 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80809] Caspase 10, Apoptosis-related Cysteine Protease (CASP10, Accession NM_032976) is a VGAM2374 host target gene. CASP10 BINDING SITE1 and CASP10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASP10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of CASP10 BINDING SITE1 and CASP10 BINDING SITE2, designated SEQ ID:26832 and SEQ ID:26835 respectively, to the nucleotide sequence of VGAM2374 RNA, herein designated VGAM RNA, also designated SEQ ID:5085.

[80810] A function of VGAM2374 is therefore inhibition of Caspase 10, Apoptosis-related Cysteine Protease (CASP10, Accession NM_032976), a gene which is one aspartate-specific cysteine protease and important in death receptor signaling or other cellular processes. Accordingly, utilities of VGAM2374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP10. The function of CASP10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.Protein Kinase, CGMP-dependent, Type I (PRKG1, Accession NM_006258) is another VGAM2374 host target gene. PRKG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKG1 BINDING SITE,

designated SEQ ID:12937, to the nucleotide sequence of VGAM2374 RNA, herein designated VGAM RNA, also designated SEQ ID:5085.

[80811] Another function of VGAM2374 is therefore inhibition of Protein Kinase, CGMP-dependent, Type I (PRKG1, Accession NM_006258), a gene which relaxes vascular smooth muscle and inhibits platelet aggregation. Accordingly, utilities of VGAM2374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKG1. The function of PRKG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1571.TNF Receptor-associated Factor 5 (TRAF5, Accession NM_004619) is another VGAM2374 host target gene. TRAF5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRAF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF5 BINDING SITE, designated SEQ ID:10962, to the nucleotide sequence of VGAM2374 RNA, herein designated VGAM RNA, also designated SEQ ID:5085.

[80812] Another function of VGAM2374 is therefore inhibition of TNF Receptor-associated Factor 5 (TRAF5, Accession NM_004619), a gene which Member of a family of proteins that interact with TNF receptors; binds the lymphotoxin beta receptor (LTBR). Accordingly, utilities of VGAM2374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF5. The function of TRAF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM76.Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Gamma Polypeptide (YWHAG, Accession NM_012479) is another VGAM2374 host target gene. YWHAG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YWHAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YWHAG BINDING SITE, designated SEQ ID:14856, to the nucleotide sequence of VGAM2374 RNA, herein designated VGAM RNA, also designated SEQ ID:5085.

[80813] Another function of VGAM2374 is therefore inhibition of

Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Gamma Polypeptide (YWHAG, Accession NM_012479), a gene which mediates mitogenic signals of PDGF in vascular smooth muscle cells. Accordingly, utilities of VGAM2374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAG. The function of YWHAG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180.FLJ10097 (Accession XM_043653) is another VGAM2374 host target gene. FLJ10097 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10097 BINDING SITE, designated SEQ ID:33987, to the nucleotide sequence of VGAM2374 RNA, herein designated VGAM RNA, also designated SEQ ID:5085.

[80814] Another function of VGAM2374 is therefore inhibition of FLJ10097 (Accession XM_043653). Accordingly, utilities of VGAM2374 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10097. KIAA0884 (Accession XM_046660) is another VGAM2374 host target gene. KIAA0884 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0884 BINDING SITE, designated SEQ ID:34777, to the nucleotide sequence of VGAM2374 RNA, herein designated VGAM RNA, also designated SEQ ID:5085.

[80815] Another function of VGAM2374 is therefore inhibition of KIAA0884 (Accession XM_046660). Accordingly, utilities of VGAM2374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0884. KIAA1058 (Accession XM_090586) is another VGAM2374 host target gene. KIAA1058 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1058 BINDING SITE, designated SEQ ID:40011, to the

nucleotide sequence of VGAM2374 RNA, herein designated VGAM RNA, also designated SEQ ID:5085.

[80816] Another function of VGAM2374 is therefore inhibition of KIAA1058 (Accession XM_090586). Accordingly, utilities of VGAM2374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1058. LANO (Accession NM_025168) is another VGAM2374 host target gene. LANO BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LANO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANO BINDING SITE, designated SEQ ID:24803, to the nucleotide sequence of VGAM2374 RNA, herein designated VGAM RNA, also designated SEQ ID:5085.

[80817] Another function of VGAM2374 is therefore inhibition of LANO (Accession NM_025168). Accordingly, utilities of VGAM2374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANO. PAIP1 (Accession XM_039946) is another VGAM2374 host target gene. PAIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by PAIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAIP1 BINDING SITE, designated SEQ ID:33234, to the nucleotide sequence of VGAM2374 RNA, herein designated VGAM RNA, also designated SEQ ID:5085.

[80818] Another function of VGAM2374 is therefore inhibition of PAIP1 (Accession XM_039946). Accordingly, utilities of VGAM2374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAIP1. Ubiquitin Specific Protease 25 (USP25, Accession NM_013396) is another VGAM2374 host target gene. USP25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP25 BINDING SITE, designated SEQ ID:15047, to the nucleotide sequence of VGAM2374 RNA, herein designated VGAM RNA, also designated SEQ ID:5085.

[80819] Another function of VGAM2374 is therefore inhibition of

Ubiquitin Specific Protease 25 (USP25, Accession NM_013396). Accordingly, utilities of VGAM2374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP25. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2375 (VGAM2375) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80820] VGAM2375 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2375 was detected is described hereinabove with reference to Figs. 1-8.

[80821] VGAM2375 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2375 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80822] VGAM2375 gene encodes a VGAM2375 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2375 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2375 precursor RNA is designated SEQ ID:2361, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2361 is located at position 217137 relative to the genome of Rat Cytomegalovirus.

[80823] VGAM2375 precursor RNA folds onto itself, forming VGAM2375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80824] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2375 folded precursor RNA into VGAM2375 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM2375 RNA is designated SEQ ID:5086, and is provided hereinbelow with reference to the sequence listing part.

[80825] VGAM2375 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2375 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2375 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80826] VGAM2375 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2375 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2375 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2375 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2375 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80827] The complementary binding of VGAM2375 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2375 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2375 host target RNA into VGAM2375 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80828] It is appreciated that VGAM2375 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2375 host target genes. The mRNA of each one of this plurality of VGAM2375 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2375 RNA, herein designated VGAM RNA, and which when bound by VGAM2375 RNA causes inhibition of translation of respective one or more VGAM2375 host target proteins.

[80829] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2375 gene, herein designated VGAM GENE, on one or more VGAM2375 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80830] It is yet further appreciated that a function of VGAM2375

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2375 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2375 correlate with, and may be deduced from, the identity of the host target genes which VGAM2375 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80831] Nucleotide sequences of the VGAM2375 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2375 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2375 are further described hereinbelow with reference to Table 1.

[80832] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2375 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2375 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80833] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2375 gene, herein designated VGAM is inhibition of expression of VGAM2375 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2375 correlate with, and may be deduced from, the identity of the target genes which VGAM2375 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80834] TIRAP (Accession NM_052887) is a VGAM2375 host target gene. TIRAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIRAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIRAP BINDING SITE, designated SEQ ID:27474, to the nucleotide sequence of VGAM2375 RNA, herein designated VGAM RNA, also designated SEQ ID:5086.

[80835] A function of VGAM2375 is therefore inhibition of TIRAP (Accession NM_052887), a gene which is a adapter involved in theTLR4 signaling pathway in the innate immune response. Accordingly, utilities of VGAM2375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIRAP. The function of TIRAP

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM189.Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM_004367) is another VGAM2375 host target gene. CCR6 BINDING SITE1 and CCR6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCR6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR6 BINDING SITE1 and CCR6 BINDING SITE2, designated SEQ ID:10575 and SEQ ID:25367 respectively, to the nucleotide sequence of VGAM2375 RNA, herein designated VGAM RNA, also designated SEQ ID:5086.

[80836] Another function of VGAM2375 is therefore inhibition of Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM_004367). Accordingly, utilities of VGAM2375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR6. ZIN (Accession NM_013403) is another VGAM2375 host target gene. ZIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZIN, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZIN BINDING SITE, designated SEQ ID:15070, to the nucleotide sequence of VGAM2375 RNA, herein designated VGAM RNA, also designated SEQ ID:5086.

[80837] Another function of VGAM2375 is therefore inhibition of ZIN (Accession NM_013403). Accordingly, utilities of VGAM2375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZIN. LOC63928 (Accession NM_022097) is another VGAM2375 host target gene. LOC63928 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC63928, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC63928 BINDING SITE, designated SEQ ID:22638, to the nucleotide sequence of VGAM2375 RNA, herein designated VGAM RNA, also designated SEQ ID:5086.

[80838] Another function of VGAM2375 is therefore inhibition of LOC63928 (Accession NM_022097). Accordingly, utilities of VGAM2375 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC63928. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2376 (VGAM2376) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80839] VGAM2376 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2376 was detected is described hereinabove with reference to Figs. 1-8.

[80840] VGAM2376 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2376 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80841] VGAM2376 gene encodes a VGAM2376 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2376 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2376 precursor RNA is desig-

nated SEQ ID:2362, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2362 is located at position 188783 relative to the genome of Rat Cytomegalovirus.

[80842] VGAM2376 precursor RNA folds onto itself, forming VGAM2376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80843] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2376 folded precursor RNA into VGAM2376 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2376 RNA is designated SEQ ID:5087, and is provided hereinbelow with reference to the sequence

listing part.

[80844] VGAM2376 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2376 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2376 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80845] VGAM2376 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2376 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2376 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2376 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2376 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80846] The complementary binding of VGAM2376 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2376 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2376 host target RNA into VGAM2376 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80847] It is appreciated that VGAM2376 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2376 host target genes. The mRNA of each one of this plurality of VGAM2376 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2376 RNA, herein designated VGAM

RNA, and which when bound by VGAM2376 RNA causes inhibition of translation of respective one or more VGAM2376 host target proteins.

[80848] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2376 gene, herein designated VGAM GENE, on one or more VGAM2376 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80849] It is yet further appreciated that a function of VGAM2376 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2376 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2376 correlate with, and may be deduced from, the identity of the host target genes which VGAM2376 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80850] Nucleotide sequences of the VGAM2376 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2376 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2376 are further described hereinbelow with reference to Table 1.

[80851] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2376 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2376 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80852] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2376 gene, herein designated VGAM is

inhibition of expression of VGAM2376 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2376 correlate with, and may be deduced from, the identity of the target genes which VGAM2376 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80853] Oligophrenin 1 (OPHN1, Accession NM_002547) is a VGAM2376 host target gene. OPHN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OPHN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPHN1 BINDING SITE, designated SEQ ID:8404, to the nucleotide sequence of VGAM2376 RNA, herein designated VGAM RNA, also designated SEQ ID:5087.

[80854] A function of VGAM2376 is therefore inhibition of Oligophrenin 1 (OPHN1, Accession NM_002547). Accordingly, utilities of VGAM2376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPHN1. X-prolyl Aminopeptidase (aminopeptidase P) 2, Membrane-bound (XPNPEP2, Accession NM_003399) is another VGAM2376 host target gene.

XPNPEP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XPNPEP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPNPEP2 BINDING SITE, designated SEQ ID:9435, to the nucleotide sequence of VGAM2376 RNA, herein designated VGAM RNA, also designated SEQ ID:5087.

[80855] Another function of VGAM2376 is therefore inhibition of X-prolyl Aminopeptidase (aminopeptidase P) 2, Membrane-bound (XPNPEP2, Accession NM_003399), a gene which is a membrane-associated X-prolyl metallopeptidase . Accordingly, utilities of VGAM2376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPNPEP2. The function of XPNPEP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2108.ATIP1 (Accession NM_020749) is another VGAM2376 host target gene. ATIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATIP1, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATIP1 BINDING SITE, designated SEQ ID:21859, to the nucleotide sequence of VGAM2376 RNA, herein designated VGAM RNA, also designated SEQ ID:5087.

[80856] Another function of VGAM2376 is therefore inhibition of ATIP1 (Accession NM_020749). Accordingly, utilities of VGAM2376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATIP1. Cab45 (Accession NM_016547) is another VGAM2376 host target gene. Cab45 BINDING SITE1 and Cab45 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by Cab45, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Cab45 BINDING SITE1 and Cab45 BINDING SITE2, designated SEQ ID:18619 and SEQ ID:18276 respectively, to the nucleotide sequence of VGAM2376 RNA, herein designated VGAM RNA, also designated SEQ ID:5087.

[80857] Another function of VGAM2376 is therefore inhibition of Cab45 (Accession NM_016547). Accordingly, utilities of VGAM2376 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with Cab45. LOC151126 (Accession XM_087103) is another VGAM2376 host target gene. LOC151126 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151126 BINDING SITE, designated SEQ ID:39056, to the nucleotide sequence of VGAM2376 RNA, herein designated VGAM RNA, also designated SEQ ID:5087.

[80858] Another function of VGAM2376 is therefore inhibition of LOC151126 (Accession XM_087103). Accordingly, utilities of VGAM2376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151126. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2377 (VGAM2377) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80859] VGAM2377 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2377 was detected is described hereinabove with reference to Figs. 1-8.

[80860] VGAM2377 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2377 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80861] VGAM2377 gene encodes a VGAM2377 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2377 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2377 precursor RNA is designated SEQ ID:2363, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2363 is located at position 197566 relative to the genome of Rat Cytomegalovirus.

[80862] VGAM2377 precursor RNA folds onto itself, forming VGAM2377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80863] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2377 folded precursor RNA into VGAM2377 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2377 RNA is designated SEQ ID:5088, and is provided hereinbelow with reference to the sequence listing part.

[80864] VGAM2377 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2377 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2377 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80865] VGAM2377 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2377 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2377 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2377 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2377 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80866] The complementary binding of VGAM2377 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2377 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2377 host target RNA into VGAM2377 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80867] It is appreciated that VGAM2377 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2377 host target genes. The mRNA of each one of this plurality of VGAM2377 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2377 RNA, herein designated VGAM RNA, and which when bound by VGAM2377 RNA causes inhibition of translation of respective one or more VGAM2377 host target proteins.

[80868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2377 gene, herein designated VGAM GENE, on one or more VGAM2377 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80869] It is yet further appreciated that a function of VGAM2377 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2377 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2377 correlate with, and may be deduced from, the identity of the host target genes which VGAM2377 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80870] Nucleotide sequences of the VGAM2377 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2377 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2377 are further described hereinbelow with reference to Table 1.

[80871] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2377 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2377 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80872] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2377 gene, herein designated VGAM is inhibition of expression of VGAM2377 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2377 correlate with, and may be deduced from, the identity of the target genes which VGAM2377 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80873] LOC151126 (Accession XM_087103) is a VGAM2377 host target gene. LOC151126 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by LOC151126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151126 BINDING SITE, designated SEQ ID:39057, to the nucleotide sequence of VGAM2377 RNA, herein designated VGAM RNA, also designated SEQ ID:5088.

[80874] A function of VGAM2377 is therefore inhibition of LOC151126 (Accession XM_087103). Accordingly, utilities of VGAM2377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151126. LOC257407 (Accession XM_173078) is another VGAM2377 host target gene. LOC257407 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257407 BINDING SITE, designated SEQ ID:46334, to the nucleotide sequence of VGAM2377 RNA, herein designated VGAM RNA, also designated SEQ ID:5088.

[80875] Another function of VGAM2377 is therefore inhibition of LOC257407 (Accession XM_173078). Accordingly, utilities

of VGAM2377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257407. LOC93626 (Accession XM_052635) is another VGAM2377 host target gene. LOC93626 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93626, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93626 BINDING SITE, designated SEQ ID:36043, to the nucleotide sequence of VGAM2377 RNA, herein designated VGAM RNA, also designated SEQ ID:5088.

[80876] Another function of VGAM2377 is therefore inhibition of LOC93626 (Accession XM_052635). Accordingly, utilities of VGAM2377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93626. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2378 (VGAM2378) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80877] VGAM2378 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2378 was detected is described hereinabove with reference to Figs. 1-8.

[80878] VGAM2378 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2378 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80879] VGAM2378 gene encodes a VGAM2378 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2378 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2378 precursor RNA is designated SEQ ID:2364, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2364 is located at position 219131 relative to the genome of Rat Cytomegalovirus.

[80880] VGAM2378 precursor RNA folds onto itself, forming VGAM2378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80881] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2378 folded precursor RNA into VGAM2378 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2378 RNA is designated SEQ ID:5089, and is provided hereinbelow with reference to the sequence listing part.

[80882] VGAM2378 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2378 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2378 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[80883] VGAM2378 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2378 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2378 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2378 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2378 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80884] The complementary binding of VGAM2378 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2378 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2378 host target RNA into VGAM2378 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80885] It is appreciated that VGAM2378 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2378 host target genes. The mRNA of each one of this plurality of VGAM2378 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2378 RNA, herein designated VGAM RNA, and which when bound by VGAM2378 RNA causes inhibition of translation of respective one or more VGAM2378 host target proteins.

[80886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2378 gene, herein designated VGAM GENE, on one or more VGAM2378 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80887] It is yet further appreciated that a function of VGAM2378 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2378 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2378 correlate with, and may be deduced from, the identity of the host target genes which VGAM2378 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80888] Nucleotide sequences of the VGAM2378 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2378 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2378 are further described hereinbelow with reference to Table 1.

[80889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2378 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2378 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80890] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2378 gene, herein designated VGAM is inhibition of expression of VGAM2378 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2378 correlate with, and may be deduced from, the identity of the target genes which VGAM2378 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80891] Presenilin 2 (Alzheimer disease 4) (PSEN2, Accession NM_000447) is a VGAM2378 host target gene. PSEN2

BINDING SITE1 and PSEN2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PSEN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSEN2 BINDING SITE1 and PSEN2 BINDING SITE2, designated SEQ ID:6035 and SEQ ID:14865 respectively, to the nucleotide sequence of VGAM2378 RNA, herein designated VGAM RNA, also designated SEQ ID:5089.

[80892] A function of VGAM2378 is therefore inhibition of Presenilin 2 (Alzheimer disease 4) (PSEN2, Accession NM_000447). Accordingly, utilities of VGAM2378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSEN2. Wingless-type MMTV Integration Site Family, Member 5B (WNT5B, Accession NM_032642) is another VGAM2378 host target gene. WNT5B BINDING SITE1 and WNT5B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WNT5B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT5B BINDING

SITE1 and WNT5B BINDING SITE2, designated SEQ ID:26358 and SEQ ID:28693 respectively, to the nucleotide sequence of VGAM2378 RNA, herein designated VGAM RNA, also designated SEQ ID:5089.

[80893] Another function of VGAM2378 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 5B (WNT5B, Accession NM_032642), a gene which is the ligand for members of the frizzled family of seven transmembrane receptors and may be a signaling molecule . Accordingly, utilities of VGAM2378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT5B. The function of WNT5B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1928.KIAA0433 (Accession NM_015216) is another VGAM2378 host target gene. KIAA0433 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0433, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0433 BINDING SITE, designated SEQ ID:17549, to the

nucleotide sequence of VGAM2378 RNA, herein designated VGAM RNA, also designated SEQ ID:5089.

[80894] Another function of VGAM2378 is therefore inhibition of KIAA0433 (Accession NM_015216). Accordingly, utilities of VGAM2378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0433. LOC149606 (Accession XM_086600) is another VGAM2378 host target gene. LOC149606 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149606, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149606 BINDING SITE, designated SEQ ID:38787, to the nucleotide sequence of VGAM2378 RNA, herein designated VGAM RNA, also designated SEQ ID:5089.

[80895] Another function of VGAM2378 is therefore inhibition of LOC149606 (Accession XM_086600). Accordingly, utilities of VGAM2378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149606. LOC255967 (Accession XM_170737) is another VGAM2378 host target gene. LOC255967 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC255967, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255967 BINDING SITE, designated SEQ ID:45495, to the nucleotide sequence of VGAM2378 RNA, herein designated VGAM RNA, also designated SEQ ID:5089.

[80896] Another function of VGAM2378 is therefore inhibition of LOC255967 (Accession XM_170737). Accordingly, utilities of VGAM2378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255967. LOC84549 (Accession NM_032509) is another VGAM2378 host target gene. LOC84549 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC84549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84549 BINDING SITE, designated SEQ ID:26262, to the nucleotide sequence of VGAM2378 RNA, herein designated VGAM RNA, also designated SEQ ID:5089.

[80897] Another function of VGAM2378 is therefore inhibition of LOC84549 (Accession NM_032509). Accordingly, utilities

of VGAM2378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2379 (VGAM2379) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80898] VGAM2379 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2379 was detected is described hereinabove with reference to Figs. 1-8.

[80899] VGAM2379 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM2379 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80900] VGAM2379 gene encodes a VGAM2379 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2379 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2379 precursor RNA is designated SEQ ID:2365, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2365 is located at position 212075 relative to the genome of Rat Cytomegalovirus.

[80901] VGAM2379 precursor RNA folds onto itself, forming VGAM2379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80902] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2379 folded precursor RNA into VGAM2379 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM2379 RNA is designated SEQ ID:5090, and

is provided hereinbelow with reference to the sequence listing part.

[80903] VGAM2379 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2379 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2379 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80904] VGAM2379 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2379 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2379 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2379 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2379 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80905] The complementary binding of VGAM2379 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2379 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2379 host target RNA into VGAM2379 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80906] It is appreciated that VGAM2379 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2379 host target genes. The mRNA of each one of this plurality of VGAM2379 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2379 RNA, herein designated VGAM RNA, and which when bound by VGAM2379 RNA causes inhibition of translation of respective one or more VGAM2379 host target proteins.

[80907] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2379 gene, herein designated VGAM GENE, on one or more VGAM2379 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80908] It is yet further appreciated that a function of VGAM2379 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2379 correlate with, and may be deduced from, the identity of the host target genes which VGAM2379 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80909] Nucleotide sequences of the VGAM2379 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2379 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2379 are further described hereinbelow with reference to Table 1.

[80910] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2379 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2379 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80911] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2379 gene, herein designated VGAM is inhibition of expression of VGAM2379 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2379 correlate with, and may be deduced from, the identity of the target genes which VGAM2379 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80912] ATP-binding Cassette, Sub-family B (MDR/TAP), Member 11 (ABCB11, Accession NM_003742) is a VGAM2379 host target gene. ABCB11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCB11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCB11 BINDING SITE, designated SEQ ID:9830, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80913] A function of VGAM2379 is therefore inhibition of ATP-binding Cassette, Sub-family B (MDR/TAP), Member 11 (ABCB11, Accession NM_003742). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

ABCB11. ADP-ribosylation Factor 1 (ARF1, Accession XM_047545) is another VGAM2379 host target gene. ARF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF1 BINDING SITE, designated SEQ ID:34993, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80914] Another function of VGAM2379 is therefore inhibition of ADP-ribosylation Factor 1 (ARF1, Accession XM_047545). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF1. Rho Guanine Nucleotide Exchange Factor (GEF) 7 (ARHGEF7, Accession NM_003899) is another VGAM2379 host target gene. ARHGEF7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHGEF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF7 BINDING SITE, designated SEQ ID:9982, to the

nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80915] Another function of VGAM2379 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 7 (ARHGEF7, Accession NM_003899), a gene which acts as a rac1 guanine nucleotide exchange factor (gef) and can induce membrane ruffling. Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF7. The function of ARHGEF7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM297.ATPase, Class VI, Type 11A (ATP11A, Accession XM_085028) is another VGAM2379 host target gene. ATP11A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11A BINDING SITE, designated SEQ ID:37805, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80916] Another function of VGAM2379 is therefore inhibition of ATPase, Class VI, Type 11A (ATP11A, Accession XM_085028). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11A. B-cell CLL/lymphoma 2 (BCL2, Accession NM_000633) is another VGAM2379 host target gene. BCL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:6263, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80917] Another function of VGAM2379 is therefore inhibition of B-cell CLL/lymphoma 2 (BCL2, Accession NM_000633). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2. Chemokine (C-X-C motif) Ligand 16 (CXCL16, Accession NM_022059) is another VGAM2379 host target gene. CXCL16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by CXCL16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXCL16 BINDING SITE, designated SEQ ID:22601, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80918] Another function of VGAM2379 is therefore inhibition of Chemokine (C-X-C motif) Ligand 16 (CXCL16, Accession NM_022059), a gene which induces calcium mobilization. Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL16. The function of CXCL16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1845.E2F Transcription Factor 3 (E2F3, Accession NM_001949) is another VGAM2379 host target gene. E2F3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by E2F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2F3 BINDING

SITE, designated SEQ ID:7671, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80919] Another function of VGAM2379 is therefore inhibition of E2F Transcription Factor 3 (E2F3, Accession NM_001949), a gene which binds dna and controls cell-cycle progression from g1 to s phase. Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F3. The function of E2F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475.Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193) is another VGAM2379 host target gene. FZD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FZD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ ID:14488, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80920] Another function of VGAM2379 is therefore inhibition of

Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled receptor family, has seven transmembrane domains. Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD4. The function of FZD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309.5-hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM_000870) is another VGAM2379 host target gene. HTR4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HTR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR4 BINDING SITE, designated SEQ ID:6545, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80921] Another function of VGAM2379 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM_000870), a gene which mediates calcium

channel currents. Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR4. The function of HTR4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM65.Integrin, Alpha 6 (ITGA6, Accession NM_000210) is another VGAM2379 host target gene. ITGA6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA6 BINDING SITE, designated SEQ ID:5704, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80922] Another function of VGAM2379 is therefore inhibition of Integrin, Alpha 6 (ITGA6, Accession NM_000210). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA6. Microtubule-associated Protein 2 (MAP2, Accession NM_031846) is another VGAM2379 host target gene. MAP2 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by MAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2 BINDING SITE, designated SEQ ID:25582, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80923] Another function of VGAM2379 is therefore inhibition of Microtubule-associated Protein 2 (MAP2, Accession NM_031846), a gene which may act in stabilizing microtubules against depolymerization.also seems to have a stiffening effect on microtubules. Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2. The function of MAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.C-myc Binding Protein (MYCBP, Accession NM_012333) is another VGAM2379 host target gene. MYCBP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYCBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of MYCBP BINDING SITE, designated SEQ ID:14727, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80924] Another function of VGAM2379 is therefore inhibition of C-myc Binding Protein (MYCBP, Accession NM_012333), a gene which binds c-Myc stimulating the activation of E-box-dependent transcription. Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCBP. The function of MYCBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM435.RNA Guanylyltransferase and 5'-phosphatase (RNGTT, Accession NM_003800) is another VGAM2379 host target gene. RNGTT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNGTT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNGTT BINDING SITE, designated SEQ ID:9897, to the nucleotide sequence of

VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80925] Another function of VGAM2379 is therefore inhibition of RNA Guanylyltransferase and 5'-phosphatase (RNGTT, Accession NM_003800), a gene which is an MRNA capping enzyme; bifunctional enzyme containing both 5'-triphosphatase and mRNA guanylyltransferase activity. Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNGTT. The function of RNGTT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM292.Splicing Factor, Arginine/serine-rich 1 (splicing factor 2, alternate splicing factor) (SFRS1, Accession NM_006924) is another VGAM2379 host target gene. SFRS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFRS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS1 BINDING SITE, designated SEQ ID:13802, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5090.

[80926] Another function of VGAM2379 is therefore inhibition of Splicing Factor, Arginine/serine-rich 1 (splicing factor 2, alternate splicing factor) (SFRS1, Accession NM_006924), a gene which plays an essential role in pre-mRNA splicing. Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS1. The function of SFRS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.Solute Carrier Family 17 (sodium phosphate), Member 4 (SLC17A4, Accession NM_005495) is another VGAM2379 host target gene. SLC17A4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC17A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A4 BINDING SITE, designated SEQ ID:12000, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80927] Another function of VGAM2379 is therefore inhibition of

Solute Carrier Family 17 (sodium phosphate), Member 4 (SLC17A4, Accession NM_005495). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A4. Solute Carrier Family 21 (organic anion transporter), Member 3 (SLC21A3, Accession NM_134431) is another VGAM2379 host target gene. SLC21A3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC21A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A3 BINDING SITE, designated SEQ ID:28674, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80928] Another function of VGAM2379 is therefore inhibition of Solute Carrier Family 21 (organic anion transporter), Member 3 (SLC21A3, Accession NM_134431), a gene which mediates the na(+)-independent transport of organic anions such as bsp and conjugated (taurocholate) and unconjugated (cholate) bile acids. Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with SLC21A3. The function of SLC21A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1965.SRY (sex determining region Y)-box 13 (SOX13, Accession NM_005686) is another VGAM2379 host target gene. SOX13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX13 BINDING SITE, designated SEQ ID:12245, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80929] Another function of VGAM2379 is therefore inhibition of SRY (sex determining region Y)-box 13 (SOX13, Accession NM_005686). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX13. Adaptor-related Protein Complex 4, Sigma 1 Subunit (AP4S1, Accession NM_007077) is another VGAM2379 host target gene. AP4S1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AP4S1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP4S1 BINDING SITE, designated SEQ ID:13943, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80930] Another function of VGAM2379 is therefore inhibition of Adaptor-related Protein Complex 4, Sigma 1 Subunit (AP4S1, Accession NM_007077). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP4S1. Chromosome 5 Open Reading Frame 5 (C5orf5, Accession NM_016603) is another VGAM2379 host target gene. C5orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C5orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf5 BINDING SITE, designated SEQ ID:18697, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80931] Another function of VGAM2379 is therefore inhibition of Chromosome 5 Open Reading Frame 5 (C5orf5, Accession NM_016603). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf5. CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM_003663) is another VGAM2379 host target gene. CGGBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CGGBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGGBP1 BINDING SITE, designated SEQ ID:9741, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80932] Another function of VGAM2379 is therefore inhibition of CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM_003663). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGGBP1. CMG2 (Accession NM_058172) is another VGAM2379 host target gene. CMG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CMG2,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMG2 BINDING SITE, designated SEQ ID:27718, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80933] Another function of VGAM2379 is therefore inhibition of CMG2 (Accession NM_058172). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMG2. DKFZP727C091 (Accession XM_038689) is another VGAM2379 host target gene. DKFZP727C091 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP727C091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727C091 BINDING SITE, designated SEQ ID:32904, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80934] Another function of VGAM2379 is therefore inhibition of

DKFZP727C091 (Accession XM_038689). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727C091. ELKS (Accession NM_015064) is another VGAM2379 host target gene. ELKS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELKS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELKS BINDING SITE, designated SEQ ID:17420, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80935] Another function of VGAM2379 is therefore inhibition of ELKS (Accession NM_015064). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELKS. KIAA0179 (Accession XM_035973) is another VGAM2379 host target gene. KIAA0179 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0179 BINDING SITE, designated SEQ ID:32367, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80936] Another function of VGAM2379 is therefore inhibition of KIAA0179 (Accession XM_035973). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0179. KIAA0265 (Accession XM_045954) is another VGAM2379 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:34629, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80937] Another function of VGAM2379 is therefore inhibition of KIAA0265 (Accession XM_045954). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265. KIAA0323 (Accession XM_032634) is another

VGAM2379 host target gene. KIAA0323 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:31697, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80938] Another function of VGAM2379 is therefore inhibition of KIAA0323 (Accession XM_032634). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323. KIAA0352 (Accession NM_014830) is another VGAM2379 host target gene. KIAA0352 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0352 BINDING SITE, designated SEQ ID:16824, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80939] Another function of VGAM2379 is therefore inhibition of KIAA0352 (Accession NM_014830). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0352. KIAA1163 (Accession XM_086231) is another VGAM2379 host target gene. KIAA1163 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1163 BINDING SITE, designated SEQ ID:38557, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80940] Another function of VGAM2379 is therefore inhibition of KIAA1163 (Accession XM_086231). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1163. MGC20235 (Accession NM_145041) is another VGAM2379 host target gene. MGC20235 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC20235, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20235 BINDING SITE, designated SEQ ID:29670, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80941] Another function of VGAM2379 is therefore inhibition of MGC20235 (Accession NM_145041). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20235. MGC4677 (Accession NM_052871) is another VGAM2379 host target gene. MGC4677 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC4677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4677 BINDING SITE, designated SEQ ID:27451, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80942] Another function of VGAM2379 is therefore inhibition of MGC4677 (Accession NM_052871). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC4677. NECL1 (Accession NM_021189) is another VGAM2379 host target gene. NECL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NECL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NECL1 BINDING SITE, designated SEQ ID:22166, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80943] Another function of VGAM2379 is therefore inhibition of NECL1 (Accession NM_021189). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NECL1. Placenta-specific 3 (PLAC3, Accession XM_045115) is another VGAM2379 host target gene. PLAC3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PLAC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAC3 BINDING SITE, designated SEQ ID:34368, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA,

also designated SEQ ID:5090.

[80944] Another function of VGAM2379 is therefore inhibition of Placenta-specific 3 (PLAC3, Accession XM_045115). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC3. LOC149603 (Accession XM_047499) is another VGAM2379 host target gene. LOC149603 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149603, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149603 BINDING SITE, designated SEQ ID:34972, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80945] Another function of VGAM2379 is therefore inhibition of LOC149603 (Accession XM_047499). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149603. LOC152445 (Accession XM_098231) is another VGAM2379 host target gene. LOC152445 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC152445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152445 BINDING SITE, designated SEQ ID:41511, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80946] Another function of VGAM2379 is therefore inhibition of LOC152445 (Accession XM_098231). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152445. LOC199992 (Accession XM_114082) is another VGAM2379 host target gene. LOC199992 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199992 BINDING SITE, designated SEQ ID:42678, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80947] Another function of VGAM2379 is therefore inhibition of LOC199992 (Accession XM_114082). Accordingly, utilities

of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199992. LOC90462 (Accession XM_031852) is another VGAM2379 host target gene. LOC90462 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90462 BINDING SITE, designated SEQ ID:31504, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80948] Another function of VGAM2379 is therefore inhibition of LOC90462 (Accession XM_031852). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90462. LOC91496 (Accession XM_038788) is another VGAM2379 host target gene. LOC91496 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91496 BINDING SITE, designated SEQ ID:32916, to the nucleotide sequence of VGAM2379 RNA, herein designated VGAM RNA, also designated SEQ ID:5090.

[80949] Another function of VGAM2379 is therefore inhibition of LOC91496 (Accession XM_038788). Accordingly, utilities of VGAM2379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91496. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2380 (VGAM2380) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80950] VGAM2380 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2380 was detected is described hereinabove with reference to Figs. 1-8.

[80951] VGAM2380 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM2380 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80952] VGAM2380 gene encodes a VGAM2380 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2380 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2380 precursor RNA is designated SEQ ID:2366, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2366 is located at position 7588 relative to the genome of Human Herpesvirus 4.

[80953] VGAM2380 precursor RNA folds onto itself, forming VGAM2380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80954] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2380 folded precursor RNA into VGAM2380 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of VGAM2380 RNA is designated SEQ ID:5091, and is provided hereinbelow with reference to the sequence listing part.

[80955] VGAM2380 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2380 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2380 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80956] VGAM2380 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2380 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2380 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2380 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2380 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80957] The complementary binding of VGAM2380 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2380 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2380 host target RNA into VGAM2380 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80958] It is appreciated that VGAM2380 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2380 host target genes. The mRNA of each one of this plurality of VGAM2380 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2380 RNA, herein designated VGAM RNA, and which when bound by VGAM2380 RNA causes inhibition of translation of respective one or more VGAM2380 host target proteins.

[80959] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2380 gene, herein designated VGAM GENE, on one or more VGAM2380 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80960] It is yet further appreciated that a function of VGAM2380 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2380 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2380 correlate with, and may be deduced from, the identity of the host target genes which VGAM2380 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80961] Nucleotide sequences of the VGAM2380 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2380 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2380 are further described hereinbelow with reference to Table 1.

[80962] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2380 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2380 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80963] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2380 gene, herein designated VGAM is inhibition of expression of VGAM2380 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2380 correlate with, and may be deduced from, the identity of the target genes which VGAM2380 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80964] Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2, Accession NM_003583) is a VGAM2380 host target gene. DYRK2 BINDING SITE1 and DYRK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DYRK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK2 BINDING SITE1 and DYRK2 BINDING SITE2, designated SEQ ID:9630 and SEQ ID:13206 respectively, to the nucleotide sequence of VGAM2380 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5091.

[80965] A function of VGAM2380 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2, Accession NM_003583). Accordingly, utilities of VGAM2380 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK2. MGC29891 (Accession NM_144618) is another VGAM2380 host target gene. MGC29891 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC29891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC29891 BINDING SITE, designated SEQ ID:29439, to the nucleotide sequence of VGAM2380 RNA, herein designated VGAM RNA, also designated SEQ ID:5091.

[80966] Another function of VGAM2380 is therefore inhibition of MGC29891 (Accession NM_144618). Accordingly, utilities of VGAM2380 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC29891. PRO1163 (Accession NM_018576) is another VGAM2380 host target gene. PRO1163 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by PRO1163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1163 BINDING SITE, designated SEQ ID:20654, to the nucleotide sequence of VGAM2380 RNA, herein designated VGAM RNA, also designated SEQ ID:5091.

[80967] Another function of VGAM2380 is therefore inhibition of PRO1163 (Accession NM_018576). Accordingly, utilities of VGAM2380 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1163. Zinc Finger Protein 294 (ZNF294, Accession XM_047829) is another VGAM2380 host target gene. ZNF294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF294 BINDING SITE, designated SEQ ID:35056, to the nucleotide sequence of VGAM2380 RNA, herein designated VGAM RNA, also designated SEQ ID:5091.

[80968] Another function of VGAM2380 is therefore inhibition of

Zinc Finger Protein 294 (ZNF294, Accession XM_047829). Accordingly, utilities of VGAM2380 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF294. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2381 (VGAM2381) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80969] VGAM2381 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2381 was detected is described hereinabove with reference to Figs. 1-8.

[80970] VGAM2381 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM2381 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80971] VGAM2381 gene encodes a VGAM2381 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2381 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2381 precursor RNA is designated SEQ ID:2367, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2367 is located at position 48597 relative to the genome of Human Herpesvirus 4.

[80972] VGAM2381 precursor RNA folds onto itself, forming VGAM2381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80973] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2381 folded precursor RNA into VGAM2381 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide se-

quence of VGAM2381 RNA is designated SEQ ID:5092, and is provided hereinbelow with reference to the sequence listing part.

[80974] VGAM2381 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2381 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2381 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80975] VGAM2381 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2381 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2381 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2381 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2381 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80976] The complementary binding of VGAM2381 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2381 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2381 host target RNA into VGAM2381 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80977] It is appreciated that VGAM2381 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2381 host target genes. The mRNA of each one of this plurality of VGAM2381 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2381 RNA, herein designated VGAM RNA, and which when bound by VGAM2381 RNA causes inhibition of translation of respective one or more VGAM2381 host target proteins.

[80978] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2381 gene, herein designated VGAM GENE, on one or more VGAM2381 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80979] It is yet further appreciated that a function of VGAM2381

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2381 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2381 correlate with, and may be deduced from, the identity of the host target genes which VGAM2381 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80980] Nucleotide sequences of the VGAM2381 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2381 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2381 are further described hereinbelow with reference to Table 1.

[80981] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2381 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2381 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80982] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2381 gene, herein designated VGAM is inhibition of expression of VGAM2381 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2381 correlate with, and may be deduced from, the identity of the target genes which VGAM2381 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80983] Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM_014246) is a VGAM2381 host target gene. CELSR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CELSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR1 BINDING SITE, designated SEQ ID:15520, to the nucleotide sequence of VGAM2381 RNA, herein designated VGAM RNA, also designated SEQ ID:5092.

[80984] A function of VGAM2381 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM_014246), a gene which is involved in contact-mediated communica-

tion. Accordingly, utilities of VGAM2381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR1. The function of CELSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459.FLJ10815 (Accession NM_018231) is another VGAM2381 host target gene. FLJ10815 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10815, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10815 BINDING SITE, designated SEQ ID:20170, to the nucleotide sequence of VGAM2381 RNA, herein designated VGAM RNA, also designated SEQ ID:5092.

[80985] Another function of VGAM2381 is therefore inhibition of FLJ10815 (Accession NM_018231). Accordingly, utilities of VGAM2381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10815. FLJ21290 (Accession NM_025034) is another VGAM2381 host target gene. FLJ21290 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ21290, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21290 BINDING SITE, designated SEQ ID:24632, to the nucleotide sequence of VGAM2381 RNA, herein designated VGAM RNA, also designated SEQ ID:5092.

[80986] Another function of VGAM2381 is therefore inhibition of FLJ21290 (Accession NM_025034). Accordingly, utilities of VGAM2381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21290. LOC122830 (Accession XM_058661) is another VGAM2381 host target gene. LOC122830 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC122830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122830 BINDING SITE, designated SEQ ID:36702, to the nucleotide sequence of VGAM2381 RNA, herein designated VGAM RNA, also designated SEQ ID:5092.

[80987] Another function of VGAM2381 is therefore inhibition of LOC122830 (Accession XM_058661). Accordingly, utilities

of VGAM2381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122830. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2382 (VGAM2382) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80988] VGAM2382 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2382 was detected is described hereinabove with reference to Figs. 1-8.

[80989] VGAM2382 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM2382 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80990] VGAM2382 gene encodes a VGAM2382 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2382 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2382 precursor RNA is designated SEQ ID:2368, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2368 is located at position 54739 relative to the genome of Human Herpesvirus 4.

[80991] VGAM2382 precursor RNA folds onto itself, forming VGAM2382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80992] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2382 folded precursor RNA into VGAM2382 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2382 RNA is designated SEQ ID:5093, and

is provided hereinbelow with reference to the sequence listing part.

[80993] VGAM2382 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2382 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2382 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80994] VGAM2382 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2382 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2382 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2382 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2382 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80995] The complementary binding of VGAM2382 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2382 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2382 host target RNA into VGAM2382 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80996] It is appreciated that VGAM2382 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2382 host target genes. The mRNA of each one of this plurality of VGAM2382 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2382 RNA, herein designated VGAM RNA, and which when bound by VGAM2382 RNA causes inhibition of translation of respective one or more VGAM2382 host target proteins.

[80997] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2382 gene, herein designated VGAM GENE, on one or more VGAM2382 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80998] It is yet further appreciated that a function of VGAM2382 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2382 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2382 correlate with, and may be deduced from, the identity of the host target genes which VGAM2382 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80999] Nucleotide sequences of the VGAM2382 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2382 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2382 are further described hereinbelow with reference to Table 1.

[81000] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2382 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2382 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81001] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2382 gene, herein designated VGAM is inhibition of expression of VGAM2382 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2382 correlate with, and may be deduced from, the identity of the target genes which VGAM2382 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81002] Paired Mesoderm Homeo Box 1 (PMX1, Accession NM_006902) is a VGAM2382 host target gene. PMX1 BINDING SITE1 and PMX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PMX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMX1 BINDING SITE1 and PMX1 BINDING SITE2, designated SEQ ID:13780 and SEQ ID:22915 respectively, to the nucleotide sequence of VGAM2382 RNA, herein designated VGAM RNA, also designated SEQ ID:5093.

[81003] A function of VGAM2382 is therefore inhibition of Paired Mesoderm Homeo Box 1 (PMX1, Accession NM_006902), a gene which acts as a transcriptional regulator of muscle creatine kinase. Accordingly, utilities of VGAM2382 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX1. The function of PMX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2383 (VGAM2383) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81004] VGAM2383 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2383 was detected is described hereinabove with reference to Figs. 1-8.

[81005] VGAM2383 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM2383 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81006] VGAM2383 gene encodes a VGAM2383 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2383 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2383 precursor RNA is designated SEQ ID:2369, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2369 is located at position 53736 relative to the genome of Human Herpesvirus 4.

[81007] VGAM2383 precursor RNA folds onto itself, forming VGAM2383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81008] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2383 folded precursor RNA into VGAM2383 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2383 RNA is designated SEQ ID:5094, and is provided hereinbelow with reference to the sequence listing part.

[81009] VGAM2383 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2383 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2383 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81010] VGAM2383 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2383 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2383 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2383 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2383 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81011] The complementary binding of VGAM2383 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2383 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2383 host target RNA into VGAM2383 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81012] It is appreciated that VGAM2383 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2383 host target genes. The mRNA of each one of this plurality of VGAM2383 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2383 RNA, herein designated VGAM RNA, and which when bound by VGAM2383 RNA causes inhibition of translation of respective one or more VGAM2383 host target proteins.

[81013] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2383 gene, herein designated VGAM GENE, on one or more VGAM2383 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81014] It is yet further appreciated that a function of VGAM2383 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2383 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2383 correlate with, and may be deduced from, the identity of the host target genes which VGAM2383 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81015] Nucleotide sequences of the VGAM2383 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2383 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2383 are further described hereinbelow with reference to Table 1.

[81016] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2383 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2383 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[81017] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2383 gene, herein designated VGAM is inhibition of expression of VGAM2383 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2383 correlate with, and may be deduced from, the identity of the target genes which VGAM2383 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81018] Fucosyltransferase 8 (alpha (1,6) Fucosyltransferase) (FUT8, Accession NM_004480) is a VGAM2383 host target gene. FUT8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FUT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT8 BINDING SITE, designated SEQ ID:10794, to the nucleotide sequence of VGAM2383 RNA, herein designated VGAM RNA, also designated SEQ ID:5094.

[81019] A function of VGAM2383 is therefore inhibition of Fucosyltransferase 8 (alpha (1,6) Fucosyltransferase) (FUT8, Accession NM_004480), a gene which transfers fucose to N-linked type complex glycopeptides from GDP-Fuc;

functions in asparagine-linked glycoprotein oligosaccharide synthesis. Accordingly, utilities of VGAM2383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT8. The function of FUT8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM64.Leucine-zipper-like Transcriptional Regulator, 1 (LZTR1, Accession NM_006767) is another VGAM2383 host target gene. LZTR1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LZTR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTR1 BINDING SITE, designated SEQ ID:13634, to the nucleotide sequence of VGAM2383 RNA, herein designated VGAM RNA, also designated SEQ ID:5094.

[81020] Another function of VGAM2383 is therefore inhibition of Leucine-zipper-like Transcriptional Regulator, 1 (LZTR1, Accession NM_006767). Accordingly, utilities of VGAM2383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTR1.

DKFZP434L187 (Accession XM_044070) is another VGAM2383 host target gene. DKFZP434L187 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434L187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L187 BINDING SITE, designated SEQ ID:34116, to the nucleotide sequence of VGAM2383 RNA, herein designated VGAM RNA, also designated SEQ ID:5094.

[81021] Another function of VGAM2383 is therefore inhibition of DKFZP434L187 (Accession XM_044070). Accordingly, utilities of VGAM2383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L187. FLJ13881 (Accession NM_024729) is another VGAM2383 host target gene. FLJ13881 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13881 BINDING SITE, designated SEQ ID:24069, to the

nucleotide sequence of VGAM2383 RNA, herein designated VGAM RNA, also designated SEQ ID:5094.

[81022] Another function of VGAM2383 is therefore inhibition of FLJ13881 (Accession NM_024729). Accordingly, utilities of VGAM2383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13881. KIAA0971 (Accession NM_014929) is another VGAM2383 host target gene. KIAA0971 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0971 BINDING SITE, designated SEQ ID:17223, to the nucleotide sequence of VGAM2383 RNA, herein designated VGAM RNA, also designated SEQ ID:5094.

[81023] Another function of VGAM2383 is therefore inhibition of KIAA0971 (Accession NM_014929). Accordingly, utilities of VGAM2383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0971. RNA Binding Motif Protein 7 (RBM7, Accession NM_016090) is another VGAM2383 host target gene. RBM7 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by RBM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM7 BINDING SITE, designated SEQ ID:18177, to the nucleotide sequence of VGAM2383 RNA, herein designated VGAM RNA, also designated SEQ ID:5094.

[81024] Another function of VGAM2383 is therefore inhibition of RNA Binding Motif Protein 7 (RBM7, Accession NM_016090). Accordingly, utilities of VGAM2383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM7. LOC151277 (Accession XM_087155) is another VGAM2383 host target gene. LOC151277 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151277 BINDING SITE, designated SEQ ID:39093, to the nucleotide sequence of VGAM2383 RNA, herein designated VGAM RNA, also designated SEQ ID:5094.

[81025] Another function of VGAM2383 is therefore inhibition of

LOC151277 (Accession XM_087155). Accordingly, utilities of VGAM2383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151277. LOC159199 (Accession XM_089441) is another VGAM2383 host target gene. LOC159199 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159199 BINDING SITE, designated SEQ ID:39977, to the nucleotide sequence of VGAM2383 RNA, herein designated VGAM RNA, also designated SEQ ID:5094.

[81026] Another function of VGAM2383 is therefore inhibition of LOC159199 (Accession XM_089441). Accordingly, utilities of VGAM2383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159199. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2384 (VGAM2384) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[81027] VGAM2384 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2384 was detected is described hereinabove with reference to Figs. 1-8.

[81028] VGAM2384 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM2384 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81029] VGAM2384 gene encodes a VGAM2384 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2384 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2384 precursor RNA is designated SEQ ID:2370, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2370 is located at position 5198 relative to the genome of Human Herpesvirus 4.

[81030] VGAM2384 precursor RNA folds onto itself, forming VGAM2384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81031] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2384 folded precursor RNA into VGAM2384 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2384 RNA is designated SEQ ID:5095, and is provided hereinbelow with reference to the sequence listing part.

[81032] VGAM2384 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2384 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2384 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81033] VGAM2384 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2384 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2384 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2384 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2384 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[81034] The complementary binding of VGAM2384 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2384 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2384 host target RNA into VGAM2384 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81035] It is appreciated that VGAM2384 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2384 host target genes. The mRNA of each one of this plurality of VGAM2384 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2384 RNA, herein designated VGAM RNA, and which when bound by VGAM2384 RNA causes inhibition of translation of respective one or more VGAM2384 host target proteins.

[81036] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2384 gene, herein designated VGAM GENE, on one

or more VGAM2384 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81037] It is yet further appreciated that a function of VGAM2384 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2384 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2384 correlate with, and may be deduced from, the identity of the host target genes which VGAM2384 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81038] Nucleotide sequences of the VGAM2384 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2384 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2384 are further described hereinbelow with reference to Table 1.

[81039] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2384 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2384 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81040] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2384 gene, herein designated VGAM is inhibition of expression of VGAM2384 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2384 correlate with, and may be deduced from, the identity of the target genes which VGAM2384 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81041] WNT1 Inducible Signaling Pathway Protein 1 (WISP1, Ac-

cession NM_003882) is a VGAM2384 host target gene. WISP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WISP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WISP1 BINDING SITE, designated SEQ ID:9963, to the nucleotide sequence of VGAM2384 RNA, herein designated VGAM RNA, also designated SEQ ID:5095.

[81042] A function of VGAM2384 is therefore inhibition of WNT1 Inducible Signaling Pathway Protein 1 (WISP1, Accession NM_003882), a gene which is a member of connective tissue growth factor family. Accordingly, utilities of VGAM2384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WISP1. The function of WISP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1656.Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM_024331) is another VGAM2384 host target gene. C20orf121 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C20orf121, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf121 BINDING SITE, designated SEQ ID:23633, to the nucleotide sequence of VGAM2384 RNA, herein designated VGAM RNA, also designated SEQ ID:5095.

[81043] Another function of VGAM2384 is therefore inhibition of Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM_024331). Accordingly, utilities of VGAM2384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf121. KIAA0763 (Accession NM_014869) is another VGAM2384 host target gene. KIAA0763 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0763 BINDING SITE, designated SEQ ID:16969, to the nucleotide sequence of VGAM2384 RNA, herein designated VGAM RNA, also designated SEQ ID:5095.

[81044] Another function of VGAM2384 is therefore inhibition of KIAA0763 (Accession NM_014869). Accordingly, utilities

of VGAM2384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0763. KIAA0820 (Accession XM_044463) is another VGAM2384 host target gene. KIAA0820 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0820 BINDING SITE, designated SEQ ID:34222, to the nucleotide sequence of VGAM2384 RNA, herein designated VGAM RNA, also designated SEQ ID:5095.

[81045] Another function of VGAM2384 is therefore inhibition of KIAA0820 (Accession XM_044463). Accordingly, utilities of VGAM2384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0820. Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869) is another VGAM2384 host target gene. SEZ6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SEZ6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of SEZ6 BINDING SITE, designated SEQ ID:36775, to the nucleotide sequence of VGAM2384 RNA, herein designated VGAM RNA, also designated SEQ ID:5095.

[81046] Another function of VGAM2384 is therefore inhibition of Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869). Accordingly, utilities of VGAM2384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEZ6. LOC152359 (Accession XM_098213) is another VGAM2384 host target gene. LOC152359 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152359, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152359 BINDING SITE, designated SEQ ID:41494, to the nucleotide sequence of VGAM2384 RNA, herein designated VGAM RNA, also designated SEQ ID:5095.

[81047] Another function of VGAM2384 is therefore inhibition of LOC152359 (Accession XM_098213). Accordingly, utilities of VGAM2384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152359. LOC161829 (Accession XM_091161) is an-

other VGAM2384 host target gene. LOC161829 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC161829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161829 BINDING SITE, designated SEQ ID:40038, to the nucleotide sequence of VGAM2384 RNA, herein designated VGAM RNA, also designated SEQ ID:5095.

[81048] Another function of VGAM2384 is therefore inhibition of LOC161829 (Accession XM_091161). Accordingly, utilities of VGAM2384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161829. LOC220739 (Accession XM_167548) is another VGAM2384 host target gene. LOC220739 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220739 BINDING SITE, designated SEQ ID:44658, to the nucleotide sequence of VGAM2384 RNA, herein designated VGAM RNA, also designated SEQ ID:5095.

[81049] Another function of VGAM2384 is therefore inhibition of LOC220739 (Accession XM_167548). Accordingly, utilities of VGAM2384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220739. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2385 (VGAM2385) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81050] VGAM2385 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2385 was detected is described hereinabove with reference to Figs. 1-8.

[81051] VGAM2385 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM2385 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81052] VGAM2385 gene encodes a VGAM2385 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2385 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2385 precursor RNA is designated SEQ ID:2371, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2371 is located at position 7899 relative to the genome of Human Herpesvirus 4.

[81053] VGAM2385 precursor RNA folds onto itself, forming VGAM2385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81054] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2385 folded precursor RNA into VGAM2385 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 90%) nucleotide sequence of VGAM2385 RNA is designated SEQ ID:5096, and is provided hereinbelow with reference to the sequence listing part.

[81055] VGAM2385 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2385 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2385 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81056] VGAM2385 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2385 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2385 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2385 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2385 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81057] The complementary binding of VGAM2385 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2385 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2385 host target RNA into VGAM2385 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81058] It is appreciated that VGAM2385 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2385 host target genes. The mRNA of each one of this plurality of VGAM2385 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2385 RNA, herein designated VGAM RNA, and which when bound by VGAM2385 RNA causes inhibition of translation of respective one or more VGAM2385 host target proteins.

[81059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2385 gene, herein designated VGAM GENE, on one or more VGAM2385 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81060] It is yet further appreciated that a function of VGAM2385 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2385 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2385 correlate with, and may be deduced from, the identity of the host target genes which VGAM2385 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81061] Nucleotide sequences of the VGAM2385 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2385 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2385 are further described hereinbelow with reference to Table 1.

[81062] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2385 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2385 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[81063] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2385 gene, herein designated VGAM is inhibition of expression of VGAM2385 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2385 correlate with, and may be deduced from, the identity of the target genes which VGAM2385 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81064] Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2, Accession NM_003583) is a VGAM2385 host target gene. DYRK2 BINDING SITE1 and DYRK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DYRK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK2 BINDING SITE1 and DYRK2 BINDING SITE2, designated SEQ ID:9630 and SEQ ID:13206 respectively, to the nucleotide sequence of VGAM2385 RNA, herein designated VGAM RNA, also designated SEQ ID:5096.

[81065] A function of VGAM2385 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase

2 (DYRK2, Accession NM_003583). Accordingly, utilities of VGAM2385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK2. MGC29891 (Accession NM_144618) is another VGAM2385 host target gene. MGC29891 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC29891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC29891 BINDING SITE, designated SEQ ID:29439, to the nucleotide sequence of VGAM2385 RNA, herein designated VGAM RNA, also designated SEQ ID:5096.

[81066] Another function of VGAM2385 is therefore inhibition of MGC29891 (Accession NM_144618). Accordingly, utilities of VGAM2385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC29891. PRO1163 (Accession NM_018576) is another VGAM2385 host target gene. PRO1163 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PRO1163 BINDING SITE, designated SEQ ID:20654, to the nucleotide sequence of VGAM2385 RNA, herein designated VGAM RNA, also designated SEQ ID:5096.

[81067] Another function of VGAM2385 is therefore inhibition of PRO1163 (Accession NM_018576). Accordingly, utilities of VGAM2385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1163. Zinc Finger Protein 294 (ZNF294, Accession XM_047829) is another VGAM2385 host target gene. ZNF294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF294 BINDING SITE, designated SEQ ID:35056, to the nucleotide sequence of VGAM2385 RNA, herein designated VGAM RNA, also designated SEQ ID:5096.

[81068] Another function of VGAM2385 is therefore inhibition of Zinc Finger Protein 294 (ZNF294, Accession XM_047829). Accordingly, utilities of VGAM2385 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with ZNF294. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2386 (VGAM2386) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81069] VGAM2386 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2386 was detected is described hereinabove with reference to Figs. 1-8.

[81070] VGAM2386 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM2386 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81071] VGAM2386 gene encodes a VGAM2386 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2386 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2386 precursor RNA is designated SEQ ID:2372, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2372 is located at position 6848 relative to the genome of Human Herpesvirus 4.

[81072] VGAM2386 precursor RNA folds onto itself, forming VGAM2386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81073] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2386 folded precursor RNA into VGAM2386 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2386 RNA is designated SEQ ID:5097, and is provided hereinbelow with reference to the sequence listing part.

[81074] VGAM2386 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2386 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2386 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81075] VGAM2386 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2386 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2386 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2386 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2386 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81076] The complementary binding of VGAM2386 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2386 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2386 host target RNA into VGAM2386 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81077] It is appreciated that VGAM2386 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2386 host target genes. The mRNA of each one of this plurality of VGAM2386 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2386 RNA, herein designated VGAM RNA, and which when bound by VGAM2386 RNA causes

inhibition of translation of respective one or more VGAM2386 host target proteins.

[81078] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2386 gene, herein designated VGAM GENE, on one or more VGAM2386 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81079] It is yet further appreciated that a function of VGAM2386 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2386 include diagnosis, prevention and

treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2386 correlate with, and may be deduced from, the identity of the host target genes which VGAM2386 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81080] Nucleotide sequences of the VGAM2386 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2386 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2386 are further described hereinbelow with reference to Table 1.

[81081] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2386 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2386 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81082] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2386 gene, herein designated VGAM is inhibition of expression of VGAM2386 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2386 correlate with, and may be deduced from, the identity of the target genes which VGAM2386 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81083] ARGBP2 (Accession NM_003603) is a VGAM2386 host target gene. ARGBP2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARGBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARGBP2 BINDING SITE, designated SEQ ID:9657, to the nucleotide sequence of VGAM2386 RNA, herein designated VGAM RNA, also designated SEQ ID:5097.

[81084] A function of VGAM2386 is therefore inhibition of ARGBP2 (Accession NM_003603). Accordingly, utilities of VGAM2386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARGBP2. FLJ00058 (Accession XM_086123) is another VGAM2386 host target gene. FLJ00058 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ00058, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00058 BINDING SITE, designated SEQ ID:38511, to the nucleotide sequence of VGAM2386 RNA, herein designated VGAM RNA, also designated SEQ ID:5097.

[81085] Another function of VGAM2386 is therefore inhibition of FLJ00058 (Accession XM_086123). Accordingly, utilities of VGAM2386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00058. IL22R (Accession NM_021258) is another VGAM2386 host target gene. IL22R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL22R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL22R BINDING SITE, designated SEQ ID:22234, to the nucleotide sequence of VGAM2386 RNA, herein designated VGAM RNA, also designated SEQ ID:5097.

[81086] Another function of VGAM2386 is therefore inhibition of IL22R (Accession NM_021258). Accordingly, utilities of VGAM2386 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with IL22R. KIAA0748 (Accession NM_014796) is another VGAM2386 host target gene. KIAA0748 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0748 BINDING SITE, designated SEQ ID:16704, to the nucleotide sequence of VGAM2386 RNA, herein designated VGAM RNA, also designated SEQ ID:5097.

[81087] Another function of VGAM2386 is therefore inhibition of KIAA0748 (Accession NM_014796). Accordingly, utilities of VGAM2386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0748. LOC147184 (Accession NM_145274) is another VGAM2386 host target gene. LOC147184 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147184 BINDING SITE, designated SEQ ID:29788, to

the nucleotide sequence of VGAM2386 RNA, herein designated VGAM RNA, also designated SEQ ID:5097.

[81088] Another function of VGAM2386 is therefore inhibition of LOC147184 (Accession NM_145274). Accordingly, utilities of VGAM2386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147184. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2387 (VGAM2387) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81089] VGAM2387 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2387 was detected is described hereinabove with reference to Figs. 1-8.

[81090] VGAM2387 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM2387 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81091] VGAM2387 gene encodes a VGAM2387 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2387 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2387 precursor RNA is designated SEQ ID:2373, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2373 is located at position 7029 relative to the genome of Human Herpesvirus 4.

[81092] VGAM2387 precursor RNA folds onto itself, forming VGAM2387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81093] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2387 folded precursor RNA into VGAM2387 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2387 RNA is designated SEQ ID:5098, and is provided hereinbelow with reference to the sequence listing part.

[81094] VGAM2387 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2387 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2387 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81095] VGAM2387 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2387 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2387 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2387 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2387 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81096] The complementary binding of VGAM2387 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2387 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2387 host target RNA into VGAM2387 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81097] It is appreciated that VGAM2387 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2387 host target genes. The mRNA of each one of this plurality of VGAM2387 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2387 RNA, herein designated VGAM RNA, and which when bound by VGAM2387 RNA causes inhibition of translation of respective one or more VGAM2387 host target proteins.

[81098] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2387 gene, herein designated VGAM GENE, on one or more VGAM2387 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81099] It is yet further appreciated that a function of VGAM2387 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2387 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2387 correlate with, and may be deduced from, the identity of the host target genes which VGAM2387 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81100] Nucleotide sequences of the VGAM2387 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2387 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2387 are further described hereinbelow with reference to Table 1.

[81101] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2387 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2387 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81102] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2387 gene, herein designated VGAM is inhibition of expression of VGAM2387 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2387 correlate with, and may be deduced from, the identity of the target genes which VGAM2387 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81103] ATPase, Ca++ Transporting, Ubiquitous (ATP2A3, Accession NM_005173) is a VGAM2387 host target gene. ATP2A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP2A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP2A3 BINDING SITE, designated SEQ ID:11673, to the nucleotide sequence of VGAM2387 RNA, herein designated VGAM RNA, also designated SEQ ID:5098.

[81104] A function of VGAM2387 is therefore inhibition of ATPase,

Ca++ Transporting, Ubiquitous (ATP2A3, Accession NM_005173). Accordingly, utilities of VGAM2387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2A3. Oculocerebrorenal Syndrome of Lowe (OCRL, Accession NM_000276) is another VGAM2387 host target gene. OCRL BINDING SITE1 and OCRL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OCRL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OCRL BINDING SITE1 and OCRL BINDING SITE2, designated SEQ ID:5817 and SEQ ID:7304 respectively, to the nucleotide sequence of VGAM2387 RNA, herein designated VGAM RNA, also designated SEQ ID:5098.

[81105] Another function of VGAM2387 is therefore inhibition of Oculocerebrorenal Syndrome of Lowe (OCRL, Accession NM_000276). Accordingly, utilities of VGAM2387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCRL. Cdc42 Guanine Nucleotide Exchange Factor (GEF) 9 (ARHGEF9, Accession NM_015185) is another VGAM2387 host target gene. ARHGEF9 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by ARHGEF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF9 BINDING SITE, designated SEQ ID:17538, to the nucleotide sequence of VGAM2387 RNA, herein designated VGAM RNA, also designated SEQ ID:5098.

[81106] Another function of VGAM2387 is therefore inhibition of Cdc42 Guanine Nucleotide Exchange Factor (GEF) 9 (ARHGEF9, Accession NM_015185). Accordingly, utilities of VGAM2387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF9. Nudix (nucleoside diphosphate linked moiety X)-type Motif 12 (NUDT12, Accession NM_031438) is another VGAM2387 host target gene. NUDT12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUDT12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT12 BINDING SITE, designated SEQ ID:25447, to the nucleotide sequence of VGAM2387 RNA, herein designated VGAM

RNA, also designated SEQ ID:5098.

[81107] Another function of VGAM2387 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 12 (NUDT12, Accession NM_031438). Accordingly, utilities of VGAM2387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT12. UBE3B (Accession XM_084941) is another VGAM2387 host target gene. UBE3B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBE3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE3B BINDING SITE, designated SEQ ID:37772, to the nucleotide sequence of VGAM2387 RNA, herein designated VGAM RNA, also designated SEQ ID:5098.

[81108] Another function of VGAM2387 is therefore inhibition of UBE3B (Accession XM_084941). Accordingly, utilities of VGAM2387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3B. LOC149506 (Accession XM_097661) is another VGAM2387 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC149506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:41002, to the nucleotide sequence of VGAM2387 RNA, herein designated VGAM RNA, also designated SEQ ID:5098.

[81109] Another function of VGAM2387 is therefore inhibition of LOC149506 (Accession XM_097661). Accordingly, utilities of VGAM2387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506. LOC153711 (Accession XM_098419) is another VGAM2387 host target gene. LOC153711 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153711 BINDING SITE, designated SEQ ID:41666, to the nucleotide sequence of VGAM2387 RNA, herein designated VGAM RNA, also designated SEQ ID:5098.

[81110] Another function of VGAM2387 is therefore inhibition of LOC153711 (Accession XM_098419). Accordingly, utilities

of VGAM2387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153711. LOC253912 (Accession XM_173222) is another VGAM2387 host target gene. LOC253912 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253912 BINDING SITE, designated SEQ ID:46483, to the nucleotide sequence of VGAM2387 RNA, herein designated VGAM RNA, also designated SEQ ID:5098.

[81111] Another function of VGAM2387 is therefore inhibition of LOC253912 (Accession XM_173222). Accordingly, utilities of VGAM2387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253912. LOC255106 (Accession XM_170805) is another VGAM2387 host target gene. LOC255106 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC255106 BINDING SITE, designated SEQ ID:45570, to the nucleotide sequence of VGAM2387 RNA, herein designated VGAM RNA, also designated SEQ ID:5098.

[81112] Another function of VGAM2387 is therefore inhibition of LOC255106 (Accession XM_170805). Accordingly, utilities of VGAM2387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255106. LOC90917 (Accession XM_034861) is another VGAM2387 host target gene. LOC90917 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90917 BINDING SITE, designated SEQ ID:32163, to the nucleotide sequence of VGAM2387 RNA, herein designated VGAM RNA, also designated SEQ ID:5098.

[81113] Another function of VGAM2387 is therefore inhibition of LOC90917 (Accession XM_034861). Accordingly, utilities of VGAM2387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90917. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2388 (VGAM2388) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81114] VGAM2388 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2388 was detected is described hereinabove with reference to Figs. 1-8.

[81115] VGAM2388 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM2388 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81116] VGAM2388 gene encodes a VGAM2388 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2388 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2388 precursor RNA is designated SEQ ID:2374, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2374 is located at position 55246 relative to the

genome of Human Herpesvirus 4.

[81117] VGAM2388 precursor RNA folds onto itself, forming VGAM2388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81118] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2388 folded precursor RNA into VGAM2388 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2388 RNA is designated SEQ ID:5099, and is provided hereinbelow with reference to the sequence listing part.

[81119] VGAM2388 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2388 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2388 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81120] VGAM2388 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2388 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2388 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2388 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2388 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81121] The complementary binding of VGAM2388 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2388 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2388 host target RNA into VGAM2388 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81122] It is appreciated that VGAM2388 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2388 host target genes. The mRNA of each one of this plurality of VGAM2388 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2388 RNA, herein designated VGAM RNA, and which when bound by VGAM2388 RNA causes inhibition of translation of respective one or more VGAM2388 host target proteins.

[81123] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2388 gene, herein designated VGAM GENE, on one or more VGAM2388 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81124] It is yet further appreciated that a function of VGAM2388 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2388 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2388

correlate with, and may be deduced from, the identity of the host target genes which VGAM2388 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81125] Nucleotide sequences of the VGAM2388 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2388 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2388 are further described hereinbelow with reference to Table 1.

[81126] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2388 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2388 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81127] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2388 gene, herein designated VGAM is inhibition of expression of VGAM2388 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2388 correlate with, and may be deduced

from, the identity of the target genes which VGAM2388 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81128] Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063) is a VGAM2388 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:11492, to the nucleotide sequence of VGAM2388 RNA, herein designated VGAM RNA, also designated SEQ ID:5099.

[81129] A function of VGAM2388 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM2388 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM314.Tripartite Motif-containing 9 (TRIM9, Acces-

sion NM_052978) is another VGAM2388 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:27552, to the nucleotide sequence of VGAM2388 RNA, herein designated VGAM RNA, also designated SEQ ID:5099.

[81130] Another function of VGAM2388 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM_052978), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked. oligosaccharides. Accordingly, utilities of VGAM2388 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.FLJ12604 (Accession XM_035022) is another VGAM2388 host target

gene. FLJ12604 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12604, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12604 BINDING SITE, designated SEQ ID:32192, to the nucleotide sequence of VGAM2388 RNA, herein designated VGAM RNA, also designated SEQ ID:5099.

[81131] Another function of VGAM2388 is therefore inhibition of FLJ12604 (Accession XM_035022). Accordingly, utilities of VGAM2388 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12604. FLJ13162 (Accession NM_025002) is another VGAM2388 host target gene. FLJ13162 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13162 BINDING SITE, designated SEQ ID:24574, to the nucleotide sequence of VGAM2388 RNA, herein designated VGAM RNA, also designated SEQ ID:5099.

[81132] Another function of VGAM2388 is therefore inhibition of FLJ13162 (Accession NM_025002). Accordingly, utilities of VGAM2388 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13162. LOC145474 (Accession XM_085147) is another VGAM2388 host target gene. LOC145474 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145474 BINDING SITE, designated SEQ ID:37869, to the nucleotide sequence of VGAM2388 RNA, herein designated VGAM RNA, also designated SEQ ID:5099.

[81133] Another function of VGAM2388 is therefore inhibition of LOC145474 (Accession XM_085147). Accordingly, utilities of VGAM2388 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145474. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2389 (VGAM2389) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[81134] VGAM2389 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2389 was detected is described hereinabove with reference to Figs. 1-8.

[81135] VGAM2389 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2389 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81136] VGAM2389 gene encodes a VGAM2389 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2389 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2389 precursor RNA is designated SEQ ID:2375, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2375 is located at position 19516 relative to the genome of Goatpox Virus.

[81137] VGAM2389 precursor RNA folds onto itself, forming VGAM2389 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81138] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2389 folded precursor RNA into VGAM2389 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2389 RNA is designated SEQ ID:5100, and is provided hereinbelow with reference to the sequence listing part.

[81139] VGAM2389 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2389 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2389 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81140] VGAM2389 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2389 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2389 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2389 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2389 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81141] The complementary binding of VGAM2389 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2389 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2389 host target RNA into VGAM2389 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81142] It is appreciated that VGAM2389 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2389 host target genes. The mRNA of each one of this plurality of VGAM2389 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2389 RNA, herein designated VGAM RNA, and which when bound by VGAM2389 RNA causes inhibition of translation of respective one or more VGAM2389 host target proteins.

[81143] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2389 gene, herein designated VGAM GENE, on one or more VGAM2389 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81144] It is yet further appreciated that a function of VGAM2389 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2389 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2389 correlate with, and may be deduced from, the identity of the host target genes which VGAM2389 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[81145] Nucleotide sequences of the VGAM2389 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2389 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2389 are further described hereinbelow with reference to Table 1.

[81146] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2389 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2389 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81147] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2389 gene, herein designated VGAM is inhibition of expression of VGAM2389 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2389 correlate with, and may be deduced from, the identity of the target genes which VGAM2389 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81148] Chloride Channel 4 (CLCN4, Accession NM_001830) is a VGAM2389 host target gene. CLCN4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CLCN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN4 BINDING SITE, designated SEQ ID:7572, to the nucleotide sequence of VGAM2389 RNA, herein designated VGAM RNA, also designated SEQ ID:5100.

[81149] A function of VGAM2389 is therefore inhibition of Chloride Channel 4 (CLCN4, Accession NM_001830), a gene which is regulation of cell volume; membrane potential stabilization, signal transduction and transepithelial transport. Accordingly, utilities of VGAM2389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN4. The function of CLCN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM558.Cannabinoid Receptor 1 (brain) (CNR1, Accession NM_016083) is another VGAM2389 host target gene. CNR1 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by CNR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNR1 BINDING SITE, designated SEQ ID:18161, to the nucleotide sequence of VGAM2389 RNA, herein designated VGAM RNA, also designated SEQ ID:5100.

[81150] Another function of VGAM2389 is therefore inhibition of Cannabinoid Receptor 1 (brain) (CNR1, Accession NM_016083), a gene which is involved in the cannabinoid-induced CNS effects. Accordingly, utilities of VGAM2389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNR1. The function of CNR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM533.Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM_078628) is another VGAM2389 host target gene. MSL3L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MSL3L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MSL3L1 BINDING SITE, designated SEQ ID:27810, to the nucleotide sequence of VGAM2389 RNA, herein designated VGAM RNA, also designated SEQ ID:5100.

[81151] Another function of VGAM2389 is therefore inhibition of Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM_078628). Accordingly, utilities of VGAM2389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSL3L1. S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM2389 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:12954, to the nucleotide sequence of VGAM2389 RNA, herein designated VGAM RNA, also designated SEQ ID:5100.

[81152] Another function of VGAM2389 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium

but binds zinc very tightly- distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM2389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1078.Cyclin M1 (CNNM1, Accession NM_020348) is another VGAM2389 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21602, to the nucleotide sequence of VGAM2389 RNA, herein designated VGAM RNA, also designated SEQ ID:5100.

[81153] Another function of VGAM2389 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM_020348). Accordingly, utilities of VGAM2389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. MGC16309 (Accession NM_033413) is an-

other VGAM2389 host target gene. MGC16309 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC16309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16309 BINDING SITE, designated SEQ ID:27238, to the nucleotide sequence of VGAM2389 RNA, herein designated VGAM RNA, also designated SEQ ID:5100.

[81154] Another function of VGAM2389 is therefore inhibition of MGC16309 (Accession NM_033413). Accordingly, utilities of VGAM2389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16309. PURG (Accession NM_013357) is another VGAM2389 host target gene. PURG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PURG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PURG BINDING SITE, designated SEQ ID:15005, to the nucleotide sequence of VGAM2389 RNA, herein designated VGAM RNA, also designated SEQ ID:5100.

[81155] Another function of VGAM2389 is therefore inhibition of PURG (Accession NM_013357). Accordingly, utilities of VGAM2389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PURG. LOC137362 (Accession XM_059905) is another VGAM2389 host target gene. LOC137362 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC137362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC137362 BINDING SITE, designated SEQ ID:37104, to the nucleotide sequence of VGAM2389 RNA, herein designated VGAM RNA, also designated SEQ ID:5100.

[81156] Another function of VGAM2389 is therefore inhibition of LOC137362 (Accession XM_059905). Accordingly, utilities of VGAM2389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137362. LOC203025 (Accession XM_114610) is another VGAM2389 host target gene. LOC203025 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203025, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203025 BINDING SITE, designated SEQ ID:42999, to the nucleotide sequence of VGAM2389 RNA, herein designated VGAM RNA, also designated SEQ ID:5100.

[81157] Another function of VGAM2389 is therefore inhibition of LOC203025 (Accession XM_114610). Accordingly, utilities of VGAM2389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203025. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2390 (VGAM2390) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81158] VGAM2390 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2390 was detected is described hereinabove with reference to Figs. 1-8.

[81159] VGAM2390 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus.

VGAM2390 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[81160] VGAM2390 gene encodes a VGAM2390 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2390 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2390 precursor RNA is designated SEQ ID:2376, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2376 is located at position 85371 relative to the genome of Goatpox Virus.

[81161] VGAM2390 precursor RNA folds onto itself, forming VGAM2390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81162] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2390 folded precursor RNA into VGAM2390

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2390 RNA is designated SEQ ID:5101, and is provided hereinbelow with reference to the sequence listing part.

[81163] VGAM2390 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2390 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2390 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81164] VGAM2390 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2390 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2390 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2390 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2390 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81165] The complementary binding of VGAM2390 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2390 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2390 host target RNA into VGAM2390 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[81166] It is appreciated that VGAM2390 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2390 host target genes. The mRNA of each one of this plurality of VGAM2390 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2390 RNA, herein designated VGAM RNA, and which when bound by VGAM2390 RNA causes inhibition of translation of respective one or more VGAM2390 host target proteins.

[81167] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2390 gene, herein designated VGAM GENE, on one or more VGAM2390 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81168] It is yet further appreciated that a function of VGAM2390 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2390 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2390 correlate with, and may be deduced from, the identity of the host target genes which VGAM2390 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81169] Nucleotide sequences of the VGAM2390 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2390 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2390 are further described hereinbelow with reference to Table 1.

[81170] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2390 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2390 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81171] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2390 gene, herein designated VGAM is inhibition of expression of VGAM2390 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2390 correlate with, and may be deduced from, the identity of the target genes which VGAM2390 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81172] Glutamate Decarboxylase 1 (brain, 67kDa) (GAD1, Accession NM_000817) is a VGAM2390 host target gene. GAD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAD1 BINDING SITE, designated SEQ ID:6478, to the nucleotide sequence of VGAM2390 RNA, herein designated

VGAM RNA, also designated SEQ ID:5101.

[81173] A function of VGAM2390 is therefore inhibition of Glutamate Decarboxylase 1 (brain, 67kDa) (GAD1, Accession NM_000817), a gene which catalyzes the conversion of glutamic acid to gamma-aminobutyric acid. Accordingly, utilities of VGAM2390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAD1. The function of GAD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM691.UDP-N-acetyl-alpha-D-galactosamine:(N-acetylneuraminyl)-galactosylglucosylceramide N-acetylgalactosaminyltransferase (GalNAc-T) (GALGT, Accession NM_001478) is another VGAM2390 host target gene. GALGT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GALGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALGT BINDING SITE, designated SEQ ID:7211, to the nucleotide sequence of VGAM2390 RNA, herein designated VGAM RNA, also designated SEQ

ID:5101.

[81174] Another function of VGAM2390 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:(N-acetylneuraminyl)-galactosylglucosylceramide N-acetylgalactosaminyltransferase (GalNAc-T) (GALGT, Accession NM_001478), a gene which is involved in the biosynthesis of gangliosides gm2, gd2 and ga2. Accordingly, utilities of VGAM2390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALGT. The function of GALGT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179.DKFZp761H2121 (Accession NM_138339) is another VGAM2390 host target gene. DKFZp761H2121 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp761H2121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of DKFZp761H2121 BINDING SITE, designated SEQ ID:28737, to the nucleotide sequence of VGAM2390 RNA, herein designated VGAM RNA, also designated SEQ ID:5101.

[81175] Another function of VGAM2390 is therefore inhibition of DKFZp761H2121 (Accession NM_138339). Accordingly, utilities of VGAM2390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761H2121. EphA7 (EPHA7, Accession NM_004440) is another VGAM2390 host target gene. EPHA7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPHA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA7 BINDING SITE, designated SEQ ID:10723, to the nucleotide sequence of VGAM2390 RNA, herein designated VGAM RNA, also designated SEQ ID:5101.

[81176] Another function of VGAM2390 is therefore inhibition of EphA7 (EPHA7, Accession NM_004440). Accordingly, utilities of VGAM2390 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with EPHA7. KIAA1655 (Accession XM_039442) is another VGAM2390 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:33089, to the nucleotide sequence of VGAM2390 RNA, herein designated VGAM RNA, also designated SEQ ID:5101.

[81177] Another function of VGAM2390 is therefore inhibition of KIAA1655 (Accession XM_039442). Accordingly, utilities of VGAM2390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. MGC2541 (Accession NM_080670) is another VGAM2390 host target gene. MGC2541 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2541, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2541 BINDING SITE, designated SEQ ID:27964, to the nucleotide sequence of VGAM2390 RNA, herein designated VGAM

RNA, also designated SEQ ID:5101.

[81178] Another function of VGAM2390 is therefore inhibition of MGC2541 (Accession NM_080670). Accordingly, utilities of VGAM2390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2541. Ring Finger Protein 2 (RNF2, Accession NM_007212) is another VGAM2390 host target gene. RNF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF2 BINDING SITE, designated SEQ ID:14076, to the nucleotide sequence of VGAM2390 RNA, herein designated VGAM RNA, also designated SEQ ID:5101.

[81179] Another function of VGAM2390 is therefore inhibition of Ring Finger Protein 2 (RNF2, Accession NM_007212). Accordingly, utilities of VGAM2390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF2. LOC139770 (Accession XM_060053) is another VGAM2390 host target gene. LOC139770 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

LOC139770, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139770 BINDING SITE, designated SEQ ID:37145, to the nucleotide sequence of VGAM2390 RNA, herein designated VGAM RNA, also designated SEQ ID:5101.

[81180] Another function of VGAM2390 is therefore inhibition of LOC139770 (Accession XM_060053). Accordingly, utilities of VGAM2390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139770. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2391 (VGAM2391) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81181] VGAM2391 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2391 was detected is described hereinabove with reference to Figs. 1-8.

[81182] VGAM2391 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Goatpox Virus. VGAM2391 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81183] VGAM2391 gene encodes a VGAM2391 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2391 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2391 precursor RNA is designated SEQ ID:2377, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2377 is located at position 22657 relative to the genome of Goatpox Virus.

[81184] VGAM2391 precursor RNA folds onto itself, forming VGAM2391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81185] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2391 folded precursor RNA into VGAM2391 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2391 RNA is designated SEQ ID:5102, and is provided hereinbelow with reference to the sequence listing part.

[81186] VGAM2391 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2391 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2391 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81187] VGAM2391 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2391 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2391 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2391 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2391 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81188] The complementary binding of VGAM2391 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2391 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2391

host target RNA into VGAM2391 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81189] It is appreciated that VGAM2391 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2391 host target genes. The mRNA of each one of this plurality of VGAM2391 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2391 RNA, herein designated VGAM RNA, and which when bound by VGAM2391 RNA causes inhibition of translation of respective one or more VGAM2391 host target proteins.

[81190] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2391 gene, herein designated VGAM GENE, on one or more VGAM2391 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81191] It is yet further appreciated that a function of VGAM2391 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2391 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2391 correlate with, and may be deduced from, the identity of the host target genes which VGAM2391 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81192] Nucleotide sequences of the VGAM2391 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2391 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2391 are further

described hereinbelow with reference to Table 1.

[81193] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2391 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2391 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81194] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2391 gene, herein designated VGAM is inhibition of expression of VGAM2391 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2391 correlate with, and may be deduced from, the identity of the target genes which VGAM2391 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81195] LOC91408 (Accession XM_038290) is a VGAM2391 host target gene. LOC91408 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91408 BINDING SITE,

designated SEQ ID:32790, to the nucleotide sequence of VGAM2391 RNA, herein designated VGAM RNA, also designated SEQ ID:5102.

[81196] A function of VGAM2391 is therefore inhibition of LOC91408 (Accession XM_038290). Accordingly, utilities of VGAM2391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91408. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2392 (VGAM2392) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81197] VGAM2392 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2392 was detected is described hereinabove with reference to Figs. 1-8.

[81198] VGAM2392 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2392 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81199] VGAM2392 gene encodes a VGAM2392 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2392 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2392 precursor RNA is designated SEQ ID:2378, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2378 is located at position 9075 relative to the genome of Goatpox Virus.

[81200] VGAM2392 precursor RNA folds onto itself, forming VGAM2392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81201] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2392 folded precursor RNA into VGAM2392 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2392 RNA is designated SEQ ID:5103, and is provided hereinbelow with reference to the sequence listing part.

[81202] VGAM2392 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2392 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2392 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81203] VGAM2392 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2392 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2392 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2392 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2392 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81204] The complementary binding of VGAM2392 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2392 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2392 host target RNA into VGAM2392 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81205] It is appreciated that VGAM2392 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2392 host target genes. The mRNA of each one of this plurality of VGAM2392 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2392 RNA, herein designated VGAM RNA, and which when bound by VGAM2392 RNA causes inhibition of translation of respective one or more VGAM2392 host target proteins.

[81206] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2392 gene, herein designated VGAM GENE, on one or more VGAM2392 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81207] It is yet further appreciated that a function of VGAM2392 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2392 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2392 correlate with, and may be deduced from, the identity of the host target genes which VGAM2392 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81208] Nucleotide sequences of the VGAM2392 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2392 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2392 are further described hereinbelow with reference to Table 1.

[81209] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2392 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2392 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81210] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2392 gene, herein designated VGAM is inhibition of expression of VGAM2392 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2392 correlate with, and may be deduced from, the identity of the target genes which VGAM2392 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81211] Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM_000165) is a VGAM2392 host target gene. GJA1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GJA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJA1 BINDING SITE, designated SEQ ID:5675, to the nucleotide sequence of VGAM2392 RNA, herein designated VGAM RNA, also designated SEQ ID:5103.

[81212] A function of VGAM2392 is therefore inhibition of Gap

Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM_000165), a gene which may act in synchronizing heart contraction and embryonic development. Accordingly, utilities of VGAM2392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJA1. The function of GJA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.Retinoblastoma 1 (including osteosarcoma) (RB1, Accession XM_165641) is another VGAM2392 host target gene. RB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RB1 BINDING SITE, designated SEQ ID:43703, to the nucleotide sequence of VGAM2392 RNA, herein designated VGAM RNA, also designated SEQ ID:5103.

[81213] Another function of VGAM2392 is therefore inhibition of Retinoblastoma 1 (including osteosarcoma) (RB1, Accession XM_165641), a gene which probably acts as a regulator of other genes. Accordingly, utilities of VGAM2392 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with RB1. The function of RB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM795.Ribulose-5-phosphate-3-epimerase (RPE, Accession XM_030834) is another VGAM2392 host target gene. RPE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPE BINDING SITE, designated SEQ ID:31155, to the nucleotide sequence of VGAM2392 RNA, herein designated VGAM RNA, also designated SEQ ID:5103.

[81214] Another function of VGAM2392 is therefore inhibition of Ribulose-5-phosphate-3-epimerase (RPE, Accession XM_030834). Accordingly, utilities of VGAM2392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPE. KIAA1078 (Accession XM_036589) is another VGAM2392 host target gene. KIAA1078 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

KIAA1078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1078 BINDING SITE, designated SEQ ID:32469, to the nucleotide sequence of VGAM2392 RNA, herein designated VGAM RNA, also designated SEQ ID:5103.

[81215] Another function of VGAM2392 is therefore inhibition of KIAA1078 (Accession XM_036589). Accordingly, utilities of VGAM2392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1078. RYK Receptor-like Tyrosine Kinase (RYK, Accession XM_093692) is another VGAM2392 host target gene. RYK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RYK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RYK BINDING SITE, designated SEQ ID:40205, to the nucleotide sequence of VGAM2392 RNA, herein designated VGAM RNA, also designated SEQ ID:5103.

[81216] Another function of VGAM2392 is therefore inhibition of RYK Receptor-like Tyrosine Kinase (RYK, Accession

XM_093692). Accordingly, utilities of VGAM2392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RYK. TBDN100 (Accession NM_025085) is another VGAM2392 host target gene. TBDN100 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBDN100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBDN100 BINDING SITE, designated SEQ ID:24694, to the nucleotide sequence of VGAM2392 RNA, herein designated VGAM RNA, also designated SEQ ID:5103.

[81217] Another function of VGAM2392 is therefore inhibition of TBDN100 (Accession NM_025085). Accordingly, utilities of VGAM2392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBDN100. LOC157627 (Accession XM_088347) is another VGAM2392 host target gene. LOC157627 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC157627 BINDING SITE, designated SEQ ID:39620, to the nucleotide sequence of VGAM2392 RNA, herein designated VGAM RNA, also designated SEQ ID:5103.

[81218] Another function of VGAM2392 is therefore inhibition of LOC157627 (Accession XM_088347). Accordingly, utilities of VGAM2392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157627. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2393 (VGAM2393) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81219] VGAM2393 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2393 was detected is described hereinabove with reference to Figs. 1-8.

[81220] VGAM2393 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2393 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[81221] VGAM2393 gene encodes a VGAM2393 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2393 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2393 precursor RNA is designated SEQ ID:2379, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2379 is located at position 35069 relative to the genome of Goatpox Virus.

[81222] VGAM2393 precursor RNA folds onto itself, forming VGAM2393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81223] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2393 folded precursor RNA into VGAM2393 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2393 RNA is designated SEQ ID:5104, and is provided hereinbelow with reference to the sequence listing part.

[81224] VGAM2393 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2393 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2393 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81225] VGAM2393 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2393 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2393 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2393 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2393 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81226] The complementary binding of VGAM2393 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2393 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2393 host target RNA into VGAM2393 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81227] It is appreciated that VGAM2393 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2393 host target genes. The mRNA of each one of this plurality of VGAM2393 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2393 RNA, herein designated VGAM RNA, and which when bound by VGAM2393 RNA causes inhibition of translation of respective one or more VGAM2393 host target proteins.

[81228] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2393 gene, herein designated VGAM GENE, on one or more VGAM2393 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81229] It is yet further appreciated that a function of VGAM2393 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2393 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2393 correlate with, and may be deduced from, the identity of the host target genes which VGAM2393 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81230] Nucleotide sequences of the VGAM2393 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2393 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2393 are further described hereinbelow with reference to Table 1.

[81231] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2393 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2393 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81232] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2393 gene, herein designated VGAM is inhibition of expression of VGAM2393 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2393 correlate with, and may be deduced from, the identity of the target genes which VGAM2393 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81233] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM_007038) is a VGAM2393 host target gene. ADAMTS5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAMTS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS5 BINDING SITE, designated SEQ ID:13917, to the nucleotide sequence of

VGAM2393 RNA, herein designated VGAM RNA, also designated SEQ ID:5104.

[81234] A function of VGAM2393 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM_007038), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM2393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS5. The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35.Synovial Sarcoma, X Breakpoint 3 (SSX3, Accession NM_021014) is another VGAM2393 host target gene. SSX3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSX3 BINDING SITE, designated SEQ ID:22002, to the nucleotide sequence of VGAM2393 RNA, herein designated VGAM RNA, also designated SEQ ID:5104.

[81235] Another function of VGAM2393 is therefore inhibition of Synovial Sarcoma, X Breakpoint 3 (SSX3, Accession NM_021014), a gene which could act as a modulator of transcription. Accordingly, utilities of VGAM2393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSX3. The function of SSX3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM835.LOC144486 (Accession XM_096608) is another VGAM2393 host target gene. LOC144486 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144486 BINDING SITE, designated SEQ ID:40416, to the nucleotide sequence of VGAM2393 RNA, herein designated VGAM RNA, also designated SEQ ID:5104.

[81236] Another function of VGAM2393 is therefore inhibition of LOC144486 (Accession XM_096608). Accordingly, utilities of VGAM2393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC144486. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2394 (VGAM2394) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81237] VGAM2394 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2394 was detected is described hereinabove with reference to Figs. 1-8.

[81238] VGAM2394 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2394 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81239] VGAM2394 gene encodes a VGAM2394 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2394 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2394 precursor RNA is designated SEQ ID:2380, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2380 is located at position 149142 relative to the genome of Goatpox Virus.

[81240] VGAM2394 precursor RNA folds onto itself, forming VGAM2394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81241] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2394 folded precursor RNA into VGAM2394 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2394 RNA is designated SEQ ID:5105, and is provided hereinbelow with reference to the sequence listing part.

[81242] VGAM2394 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2394 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2394 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81243] VGAM2394 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2394 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2394 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2394 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2394 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81244] The complementary binding of VGAM2394 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2394 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2394 host target RNA into VGAM2394 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81245] It is appreciated that VGAM2394 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2394 host target genes. The mRNA of each one of this plurality of VGAM2394 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2394 RNA, herein designated VGAM RNA, and which when bound by VGAM2394 RNA causes

inhibition of translation of respective one or more VGAM2394 host target proteins.

[81246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2394 gene, herein designated VGAM GENE, on one or more VGAM2394 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81247] It is yet further appreciated that a function of VGAM2394 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2394 include diagnosis, prevention and

treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2394 correlate with, and may be deduced from, the identity of the host target genes which VGAM2394 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81248] Nucleotide sequences of the VGAM2394 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2394 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2394 are further described hereinbelow with reference to Table 1.

[81249] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2394 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2394 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81250] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2394 gene, herein designated VGAM is inhibition of expression of VGAM2394 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2394 correlate with, and may be deduced from, the identity of the target genes which VGAM2394 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81251] Ankyrin 1, Erythrocytic (ANK1, Accession NM_020481) is a VGAM2394 host target gene. ANK1 BINDING SITE1 through ANK1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE1 through ANK1 BINDING SITE3, designated SEQ ID:21734, SEQ ID:21732 and SEQ ID:21733 respectively, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81252] A function of VGAM2394 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession NM_020481). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. Doublesex and Mab-3 Related Transcription Factor 1 (DMRT1, Accession NM_021951) is another

VGAM2394 host target gene. DMRT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DMRT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMRT1 BINDING SITE, designated SEQ ID:22479, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81253] Another function of VGAM2394 is therefore inhibition of Doublesex and Mab-3 Related Transcription Factor 1 (DMRT1, Accession NM_021951), a gene which May be involved in male sexual development. Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMRT1. The function of DMRT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM59.Exostoses (multiple)-like 3 (EXTL3, Accession NM_001440) is another VGAM2394 host target gene. EXTL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EXTL3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL3 BINDING SITE, designated SEQ ID:7165, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81254] Another function of VGAM2394 is therefore inhibition of Exostoses (multiple)-like 3 (EXTL3, Accession NM_001440), a gene which a member of the multiple exostoses gene family. Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL3. The function of EXTL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.Integrin, Alpha 6 (ITGA6, Accession NM_000210) is another VGAM2394 host target gene. ITGA6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA6 BINDING SITE, designated SEQ ID:5700, to the nu-

cleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81255] Another function of VGAM2394 is therefore inhibition of Integrin, Alpha 6 (ITGA6, Accession NM_000210). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA6. NEBL (Accession NM_006393) is another VGAM2394 host target gene. NEBL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NEBL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEBL BINDING SITE, designated SEQ ID:13096, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81256] Another function of VGAM2394 is therefore inhibition of NEBL (Accession NM_006393). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEBL. Tumor Necrosis Factor (ligand) Superfamily, Member 10 (TNFSF10, Accession NM_003810) is another VGAM2394 host target gene. TNFSF10 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by TNFSF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF10 BINDING SITE, designated SEQ ID:9900, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81257] Another function of VGAM2394 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 10 (TNFSF10, Accession NM_003810), a gene which mediates cell death. Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF10. The function of TNFSF10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM637.WAS Protein Family, Member 3 (WASF3, Accession NM_006646) is another VGAM2394 host target gene. WASF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WASF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of WASF3 BINDING SITE, designated SEQ ID:13439, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81258] Another function of VGAM2394 is therefore inhibition of WAS Protein Family, Member 3 (WASF3, Accession NM_006646), a gene which stimulates actin polymerization. Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WASF3. The function of WASF3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1692.Chromosome 15 Open Reading Frame 5 (C15orf5, Accession NM_030944) is another VGAM2394 host target gene. C15orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C15orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C15orf5 BINDING SITE, designated SEQ ID:25212, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5105.

[81259] Another function of VGAM2394 is therefore inhibition of Chromosome 15 Open Reading Frame 5 (C15orf5, Accession NM_030944). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C15orf5. Centaurin, Alpha 2 (CENTA2, Accession NM_018404) is another VGAM2394 host target gene. CENTA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CENTA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTA2 BINDING SITE, designated SEQ ID:20441, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81260] Another function of VGAM2394 is therefore inhibition of Centaurin, Alpha 2 (CENTA2, Accession NM_018404). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTA2. Fatty Acid Desaturase 1 (FADS1, Accession NM_013402) is another VGAM2394 host target gene. FADS1 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by FADS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FADS1 BINDING SITE, designated SEQ ID:15066, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81261] Another function of VGAM2394 is therefore inhibition of Fatty Acid Desaturase 1 (FADS1, Accession NM_013402). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FADS1. FLJ11088 (Accession NM_018318) is another VGAM2394 host target gene. FLJ11088 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11088, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11088 BINDING SITE, designated SEQ ID:20311, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81262] Another function of VGAM2394 is therefore inhibition of FLJ11088 (Accession NM_018318). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11088. HSNOV1 (Accession NM_017515) is another VGAM2394 host target gene. HSNOV1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSNOV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSNOV1 BINDING SITE, designated SEQ ID:18963, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81263] Another function of VGAM2394 is therefore inhibition of HSNOV1 (Accession NM_017515). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSNOV1. Potassium Voltage-gated Channel, Subfamily H (eag-related), Member 8 (KCNH8, Accession NM_144633) is another VGAM2394 host target gene. KCNH8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNH8, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNH8 BINDING SITE, designated SEQ ID:29453, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81264] Another function of VGAM2394 is therefore inhibition of Potassium Voltage-gated Channel, Subfamily H (eag-related), Member 8 (KCNH8, Accession NM_144633). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNH8. KIAA0087 (Accession NM_014769) is another VGAM2394 host target gene. KIAA0087 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0087, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0087 BINDING SITE, designated SEQ ID:16555, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81265] Another function of VGAM2394 is therefore inhibition of

KIAA0087 (Accession NM_014769). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0087. KIAA0217 (Accession XM_040265) is another VGAM2394 host target gene. KIAA0217 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0217 BINDING SITE, designated SEQ ID:33278, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81266] Another function of VGAM2394 is therefore inhibition of KIAA0217 (Accession XM_040265). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0217. KIAA0350 (Accession XM_028332) is another VGAM2394 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30657, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81267] Another function of VGAM2394 is therefore inhibition of KIAA0350 (Accession XM_028332). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. KIAA1128 (Accession XM_043596) is another VGAM2394 host target gene. KIAA1128 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:33966, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81268] Another function of VGAM2394 is therefore inhibition of KIAA1128 (Accession XM_043596). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1128. Kallikrein 7 (chymotryptic, stratum corneum)

(KLK7, Accession NM_005046) is another VGAM2394 host target gene. KLK7 BINDING SITE1 and KLK7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KLK7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLK7 BINDING SITE1 and KLK7 BINDING SITE2, designated SEQ ID:11475 and SEQ ID:29272 respectively, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81269] Another function of VGAM2394 is therefore inhibition of Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NM_005046). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK7. MGC4827 (Accession NM_024114) is another VGAM2394 host target gene. MGC4827 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4827 BINDING SITE, designated

SEQ ID:23566, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81270] Another function of VGAM2394 is therefore inhibition of MGC4827 (Accession NM_024114). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4827. MGC4832 (Accession NM_145061) is another VGAM2394 host target gene. MGC4832 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4832 BINDING SITE, designated SEQ ID:29698, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81271] Another function of VGAM2394 is therefore inhibition of MGC4832 (Accession NM_145061). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4832. SNRK (Accession NM_017719) is another VGAM2394 host target gene. SNRK BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by SNRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNRK BINDING SITE, designated SEQ ID:19308, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81272] Another function of VGAM2394 is therefore inhibition of SNRK (Accession NM_017719). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNRK. LOC145842 (Accession XM_085254) is another VGAM2394 host target gene. LOC145842 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145842 BINDING SITE, designated SEQ ID:37995, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81273] Another function of VGAM2394 is therefore inhibition of

LOC145842 (Accession XM_085254). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145842. LOC149111 (Accession XM_086429) is another VGAM2394 host target gene. LOC149111 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149111 BINDING SITE, designated SEQ ID:38647, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81274] Another function of VGAM2394 is therefore inhibition of LOC149111 (Accession XM_086429). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149111. LOC155435 (Accession XM_088257) is another VGAM2394 host target gene. LOC155435 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC155435 BINDING SITE, designated SEQ ID:39566, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81275] Another function of VGAM2394 is therefore inhibition of LOC155435 (Accession XM_088257). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155435. LOC201562 (Accession XM_114343) is another VGAM2394 host target gene. LOC201562 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201562 BINDING SITE, designated SEQ ID:42882, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81276] Another function of VGAM2394 is therefore inhibition of LOC201562 (Accession XM_114343). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201562. LOC219401 (Accession XM_166706) is an-

other VGAM2394 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:44585, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81277] Another function of VGAM2394 is therefore inhibition of LOC219401 (Accession XM_166706). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. LOC220766 (Accession XM_165471) is another VGAM2394 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:43646, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81278] Another function of VGAM2394 is therefore inhibition of LOC220766 (Accession XM_165471). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC221495 (Accession XM_168136) is another VGAM2394 host target gene. LOC221495 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221495 BINDING SITE, designated SEQ ID:45056, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81279] Another function of VGAM2394 is therefore inhibition of LOC221495 (Accession XM_168136). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221495. LOC256112 (Accession XM_172829) is another VGAM2394 host target gene. LOC256112 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256112, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256112 BINDING SITE, designated SEQ ID:46102, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81280] Another function of VGAM2394 is therefore inhibition of LOC256112 (Accession XM_172829). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256112. LOC256846 (Accession XM_170921) is another VGAM2394 host target gene. LOC256846 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256846 BINDING SITE, designated SEQ ID:45696, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81281] Another function of VGAM2394 is therefore inhibition of LOC256846 (Accession XM_170921). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC256846. LOC86651 (Accession XM_044052) is another VGAM2394 host target gene. LOC86651 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC86651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC86651 BINDING SITE, designated SEQ ID:34096, to the nucleotide sequence of VGAM2394 RNA, herein designated VGAM RNA, also designated SEQ ID:5105.

[81282] Another function of VGAM2394 is therefore inhibition of LOC86651 (Accession XM_044052). Accordingly, utilities of VGAM2394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC86651. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2395 (VGAM2395) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81283] VGAM2395 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2395 was detected is described hereinabove with reference to Figs. 1-8.

[81284] VGAM2395 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2395 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81285] VGAM2395 gene encodes a VGAM2395 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2395 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2395 precursor RNA is designated SEQ ID:2381, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2381 is located at position 120551 relative to the genome of Goatpox Virus.

[81286] VGAM2395 precursor RNA folds onto itself, forming VGAM2395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81287] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2395 folded precursor RNA into VGAM2395 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2395 RNA is designated SEQ ID:5106, and is provided hereinbelow with reference to the sequence listing part.

[81288] VGAM2395 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2395 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2395 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81289] VGAM2395 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2395 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2395 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2395 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2395 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81290] The complementary binding of VGAM2395 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2395 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2395 host target RNA into VGAM2395 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81291] It is appreciated that VGAM2395 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2395 host target genes. The mRNA of each one of this plurality of VGAM2395 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2395 RNA, herein designated VGAM RNA, and which when bound by VGAM2395 RNA causes inhibition of translation of respective one or more VGAM2395 host target proteins.

[81292] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2395 gene, herein designated VGAM GENE, on one or more VGAM2395 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81293] It is yet further appreciated that a function of VGAM2395 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2395 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2395 correlate with, and may be deduced from, the identity of the host target genes which VGAM2395 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81294] Nucleotide sequences of the VGAM2395 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2395 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2395 are further described hereinbelow with reference to Table 1.

[81295] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2395 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2395 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81296] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2395 gene, herein designated VGAM is inhibition of expression of VGAM2395 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2395 correlate with, and may be deduced from, the identity of the target genes which VGAM2395 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81297] MGC4832 (Accession NM_145061) is a VGAM2395 host target gene. MGC4832 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4832, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4832 BINDING SITE, designated SEQ ID:29702, to the nucleotide sequence of VGAM2395 RNA, herein designated VGAM RNA, also designated SEQ ID:5106.

[81298] A function of VGAM2395 is therefore inhibition of MGC4832 (Accession NM_145061). Accordingly, utilities of VGAM2395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4832. Palmdelphin (PALMD, Accession NM_017734) is another VGAM2395 host target gene. PALMD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PALMD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PALMD BINDING SITE, designated SEQ ID:19320, to the nucleotide sequence of VGAM2395 RNA, herein designated VGAM RNA, also designated SEQ ID:5106.

[81299] Another function of VGAM2395 is therefore inhibition of Palmdelphin (PALMD, Accession NM_017734). Accordingly, utilities of VGAM2395 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with PALMD. LOC151647 (Accession XM_087261) is another VGAM2395 host target gene. LOC151647 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151647, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151647 BINDING SITE, designated SEQ ID:39160, to the nucleotide sequence of VGAM2395 RNA, herein designated VGAM RNA, also designated SEQ ID:5106.

[81300] Another function of VGAM2395 is therefore inhibition of LOC151647 (Accession XM_087261). Accordingly, utilities of VGAM2395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151647. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2396 (VGAM2396) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81301] VGAM2396 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2396 was detected is described hereinabove with reference to Figs. 1-8.

[81302] VGAM2396 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2396 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81303] VGAM2396 gene encodes a VGAM2396 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2396 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2396 precursor RNA is designated SEQ ID:2382, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2382 is located at position 93517 relative to the genome of Goatpox Virus.

[81304] VGAM2396 precursor RNA folds onto itself, forming VGAM2396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81305] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2396 folded precursor RNA into VGAM2396 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2396 RNA is designated SEQ ID:5107, and is provided hereinbelow with reference to the sequence listing part.

[81306] VGAM2396 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2396 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2396 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81307] VGAM2396 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2396 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2396 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2396 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2396 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81308] The complementary binding of VGAM2396 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2396 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2396 host target RNA into VGAM2396 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81309] It is appreciated that VGAM2396 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2396 host target genes. The mRNA of each one of this plurality of VGAM2396 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2396 RNA, herein designated VGAM RNA, and which when bound by VGAM2396 RNA causes inhibition of translation of respective one or more VGAM2396 host target proteins.

[81310] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2396 gene, herein designated VGAM GENE, on one or more VGAM2396 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81311] It is yet further appreciated that a function of VGAM2396 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2396 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2396 correlate with, and may be deduced from, the identity of the host target genes which VGAM2396 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81312] Nucleotide sequences of the VGAM2396 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2396 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2396 are further described hereinbelow with reference to Table 1.

[81313] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2396 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2396 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81314] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2396 gene, herein designated VGAM is inhibition of expression of VGAM2396 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2396 correlate with, and may be deduced from, the identity of the target genes which VGAM2396 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81315] A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, alpha, converting enzyme) (ADAM17, Accession NM_003183) is a VGAM2396 host target gene.

ADAM17 BINDING SITE1 and ADAM17 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAM17, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM17 BINDING SITE1 and ADAM17 BINDING SITE2, designated SEQ ID:9157 and SEQ ID:22410 respectively, to the nucleotide sequence of VGAM2396 RNA, herein designated VGAM RNA, also designated SEQ ID:5107.

[81316] A function of VGAM2396 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, alpha, converting enzyme) (ADAM17, Accession NM_003183), a gene which member of ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM2396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM17. The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264.DKFZP586D2223 (Accession NM_018561) is another VGAM2396 host target gene. DKFZP586D2223 BINDING SITE is HOST TARGET binding site found in the

5` untranslated region of mRNA encoded by DKFZP586D2223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586D2223 BINDING SITE, designated SEQ ID:20643, to the nucleotide sequence of VGAM2396 RNA, herein designated VGAM RNA, also designated SEQ ID:5107.

[81317] Another function of VGAM2396 is therefore inhibition of DKFZP586D2223 (Accession NM_018561). Accordingly, utilities of VGAM2396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586D2223. FLJ20276 (Accession NM_017738) is another VGAM2396 host target gene. FLJ20276 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20276 BINDING SITE, designated SEQ ID:19325, to the nucleotide sequence of VGAM2396 RNA, herein designated VGAM RNA, also designated SEQ ID:5107.

[81318] Another function of VGAM2396 is therefore inhibition of

FLJ20276 (Accession NM_017738). Accordingly, utilities of VGAM2396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20276. LOC150848 (Accession XM_097959) is another VGAM2396 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:41255, to the nucleotide sequence of VGAM2396 RNA, herein designated VGAM RNA, also designated SEQ ID:5107.

[81319] Another function of VGAM2396 is therefore inhibition of LOC150848 (Accession XM_097959). Accordingly, utilities of VGAM2396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150848. LOC93206 (Accession XM_049838) is another VGAM2396 host target gene. LOC93206 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93206, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC93206 BINDING SITE, designated SEQ ID:35516, to the nucleotide sequence of VGAM2396 RNA, herein designated VGAM RNA, also designated SEQ ID:5107.

[81320] Another function of VGAM2396 is therefore inhibition of LOC93206 (Accession XM_049838). Accordingly, utilities of VGAM2396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93206. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2397 (VGAM2397) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81321] VGAM2397 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2397 was detected is described hereinabove with reference to Figs. 1-8.

[81322] VGAM2397 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2397 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[81323] VGAM2397 gene encodes a VGAM2397 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2397 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2397 precursor RNA is designated SEQ ID:2383, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2383 is located at position 149485 relative to the genome of Goatpox Virus.

[81324] VGAM2397 precursor RNA folds onto itself, forming VGAM2397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81325] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2397 folded precursor RNA into VGAM2397 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2397 RNA is designated SEQ ID:5108, and is provided hereinbelow with reference to the sequence listing part.

[81326] VGAM2397 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2397 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2397 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81327] VGAM2397 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2397 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2397 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2397 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2397 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81328] The complementary binding of VGAM2397 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2397 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2397 host target RNA into VGAM2397 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81329] It is appreciated that VGAM2397 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2397 host target genes. The mRNA of each one of this plurality of VGAM2397 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2397 RNA, herein designated VGAM RNA, and which when bound by VGAM2397 RNA causes inhibition of translation of respective one or more VGAM2397 host target proteins.

[81330] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2397 gene, herein designated VGAM GENE, on one or more VGAM2397 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81331] It is yet further appreciated that a function of VGAM2397 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2397 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2397 correlate with, and may be deduced from, the identity of the host target genes which VGAM2397 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81332] Nucleotide sequences of the VGAM2397 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2397 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2397 are further described hereinbelow with reference to Table 1.

[81333] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2397 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2397 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81334] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2397 gene, herein designated VGAM is inhibition of expression of VGAM2397 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2397 correlate with, and may be deduced from, the identity of the target genes which VGAM2397 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81335] Component of Oligomeric Golgi Complex 3 (COG3, Accession NM_031431) is a VGAM2397 host target gene. COG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COG3 BINDING SITE, designated SEQ ID:25426, to the nucleotide sequence of VGAM2397 RNA, herein designated VGAM RNA, also designated SEQ ID:5108.

[81336] A function of VGAM2397 is therefore inhibition of Component of Oligomeric Golgi Complex 3 (COG3, Accession NM_031431), a gene which is critical for the structure and function of the Golgi apparatus. Accordingly, utilities of VGAM2397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COG3. The function of COG3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2069.Chromobox Homolog 3 (HP1 gamma homolog, Drosophila) (CBX3, Accession NM_016587) is another VGAM2397 host target gene. CBX3 BINDING SITE1 and CBX3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CBX3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBX3 BINDING SITE1 and CBX3 BINDING SITE2, designated SEQ ID:18659 and SEQ ID:14139 respectively, to the nucleotide sequence of VGAM2397 RNA, herein designated VGAM RNA, also designated SEQ ID:5108.

[81337] Another function of VGAM2397 is therefore inhibition of Chromobox Homolog 3 (HP1 gamma homolog,

Drosophila) (CBX3, Accession NM_016587). Accordingly, utilities of VGAM2397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2398 (VGAM2398) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81338] VGAM2398 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2398 was detected is described hereinabove with reference to Figs. 1-8.

[81339] VGAM2398 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2398 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81340] VGAM2398 gene encodes a VGAM2398 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2398 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2398 precursor RNA is designated SEQ ID:2384, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2384 is located at position 101040 relative to the genome of Goatpox Virus.

[81341] VGAM2398 precursor RNA folds onto itself, forming VGAM2398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81342] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2398 folded precursor RNA into VGAM2398 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM2398 RNA is designated SEQ ID:5109, and is provided hereinbelow with reference to the sequence listing part.

[81343] VGAM2398 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2398 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2398 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81344] VGAM2398 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2398 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2398 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2398 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2398 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81345] The complementary binding of VGAM2398 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2398 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2398 host target RNA into VGAM2398 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81346] It is appreciated that VGAM2398 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2398 host target genes. The mRNA of each one of this plurality of VGAM2398 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2398 RNA, herein designated VGAM RNA, and which when bound by VGAM2398 RNA causes inhibition of translation of respective one or more VGAM2398 host target proteins.

[81347] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2398 gene, herein designated VGAM GENE, on one or more VGAM2398 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81348] It is yet further appreciated that a function of VGAM2398

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2398 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2398 correlate with, and may be deduced from, the identity of the host target genes which VGAM2398 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81349] Nucleotide sequences of the VGAM2398 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2398 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2398 are further described hereinbelow with reference to Table 1.

[81350] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2398 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2398 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81351] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2398 gene, herein designated VGAM is inhibition of expression of VGAM2398 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2398 correlate with, and may be deduced from, the identity of the target genes which VGAM2398 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81352] Frizzled Homolog 7 (Drosophila) (FZD7, Accession NM_003507) is a VGAM2398 host target gene. FZD7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FZD7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD7 BINDING SITE, designated SEQ ID:9598, to the nucleotide sequence of VGAM2398 RNA, herein designated VGAM RNA, also designated SEQ ID:5109.

[81353] A function of VGAM2398 is therefore inhibition of Frizzled Homolog 7 (Drosophila) (FZD7, Accession NM_003507), a gene which enhances beta-catenin mediated signaling. Accordingly, utilities of VGAM2398 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with FZD7. The function of FZD7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1063.LEC3 (Accession NM_015236) is another VGAM2398 host target gene. LEC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LEC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEC3 BINDING SITE, designated SEQ ID:17567, to the nucleotide sequence of VGAM2398 RNA, herein designated VGAM RNA, also designated SEQ ID:5109.

[81354] Another function of VGAM2398 is therefore inhibition of LEC3 (Accession NM_015236). Accordingly, utilities of VGAM2398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEC3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2399 (VGAM2399) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81355] VGAM2399 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2399 was detected is described hereinabove with reference to Figs. 1-8.

[81356] VGAM2399 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2399 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81357] VGAM2399 gene encodes a VGAM2399 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2399 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2399 precursor RNA is designated SEQ ID:2385, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2385 is located at position 23504 relative to the genome of Goatpox Virus.

[81358] VGAM2399 precursor RNA folds onto itself, forming VGAM2399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81359] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2399 folded precursor RNA into VGAM2399 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2399 RNA is designated SEQ ID:5110, and is provided hereinbelow with reference to the sequence listing part.

[81360] VGAM2399 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2399 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2399 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[81361] VGAM2399 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2399 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2399 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2399 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2399 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81362] The complementary binding of VGAM2399 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2399 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2399 host target RNA into VGAM2399 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81363] It is appreciated that VGAM2399 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2399 host target genes. The mRNA of each one of this plurality of VGAM2399 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2399 RNA, herein designated VGAM RNA, and which when bound by VGAM2399 RNA causes inhibition of translation of respective one or more VGAM2399 host target proteins.

[81364] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2399 gene, herein designated VGAM GENE, on one or more VGAM2399 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81365] It is yet further appreciated that a function of VGAM2399 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2399 correlate with, and may be deduced from, the identity of the host target genes which VGAM2399 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81366] Nucleotide sequences of the VGAM2399 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2399 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2399 are further described hereinbelow with reference to Table 1.

[81367] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2399 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2399 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81368] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2399 gene, herein designated VGAM is inhibition of expression of VGAM2399 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2399 correlate with, and may be deduced from, the identity of the target genes which VGAM2399 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81369] ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052) is a

VGAM2399 host target gene. ATP7A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE, designated SEQ ID:5495, to the nucleotide sequence of VGAM2399 RNA, herein designated VGAM RNA, also designated SEQ ID:5110.

[81370] A function of VGAM2399 is therefore inhibition of ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052). Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A. Forkhead Box F2 (FOXF2, Accession NM_001452) is another VGAM2399 host target gene. FOXF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FOXF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXF2 BINDING SITE, designated SEQ ID:7187, to the nucleotide sequence of VGAM2399 RNA, herein

designated VGAM RNA, also designated SEQ ID:5110.

[81371] Another function of VGAM2399 is therefore inhibition of Forkhead Box F2 (FOXF2, Accession NM_001452), a gene which is a probable transcription activator for a number of lung- specific genes. Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXF2. The function of FOXF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217.FLJ12085 (Accession NM_022771) is another VGAM2399 host target gene. FLJ12085 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12085 BINDING SITE, designated SEQ ID:23033, to the nucleotide sequence of VGAM2399 RNA, herein designated VGAM RNA, also designated SEQ ID:5110.

[81372] Another function of VGAM2399 is therefore inhibition of FLJ12085 (Accession NM_022771). Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12085. FLJ20502 (Accession NM_017845) is another VGAM2399 host target gene. FLJ20502 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20502, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20502 BINDING SITE, designated SEQ ID:19508, to the nucleotide sequence of VGAM2399 RNA, herein designated VGAM RNA, also designated SEQ ID:5110.

[81373] Another function of VGAM2399 is therefore inhibition of FLJ20502 (Accession NM_017845). Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20502. KIAA0826 (Accession XM_093839) is another VGAM2399 host target gene. KIAA0826 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0826 BINDING SITE, designated SEQ ID:40215, to the

nucleotide sequence of VGAM2399 RNA, herein designated VGAM RNA, also designated SEQ ID:5110.

[81374] Another function of VGAM2399 is therefore inhibition of KIAA0826 (Accession XM_093839). Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0826. KIAA0903 (Accession XM_049251) is another VGAM2399 host target gene. KIAA0903 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0903 BINDING SITE, designated SEQ ID:35369, to the nucleotide sequence of VGAM2399 RNA, herein designated VGAM RNA, also designated SEQ ID:5110.

[81375] Another function of VGAM2399 is therefore inhibition of KIAA0903 (Accession XM_049251). Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0903. KIAA1729 (Accession XM_114418) is another VGAM2399 host target gene. KIAA1729 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by KIAA1729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1729 BINDING SITE, designated SEQ ID:42945, to the nucleotide sequence of VGAM2399 RNA, herein designated VGAM RNA, also designated SEQ ID:5110.

[81376] Another function of VGAM2399 is therefore inhibition of KIAA1729 (Accession XM_114418). Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1729. Ligand of Numb-protein X (LNX, Accession NM_032622) is another VGAM2399 host target gene. LNX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LNX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LNX BINDING SITE, designated SEQ ID:26338, to the nucleotide sequence of VGAM2399 RNA, herein designated VGAM RNA, also designated SEQ ID:5110.

[81377] Another function of VGAM2399 is therefore inhibition of Ligand of Numb-protein X (LNX, Accession NM_032622).

Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNX. PRO1866 (Accession NM_018510) is another VGAM2399 host target gene. PRO1866 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1866 BINDING SITE, designated SEQ ID:20582, to the nucleotide sequence of VGAM2399 RNA, herein designated VGAM RNA, also designated SEQ ID:5110.

[81378] Another function of VGAM2399 is therefore inhibition of PRO1866 (Accession NM_018510). Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1866. LOC122830 (Accession XM_058661) is another VGAM2399 host target gene. LOC122830 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC122830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC122830 BINDING SITE, designated SEQ ID:36703, to the nucleotide sequence of VGAM2399 RNA, herein designated VGAM RNA, also designated SEQ ID:5110.

[81379] Another function of VGAM2399 is therefore inhibition of LOC122830 (Accession XM_058661). Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122830. LOC170372 (Accession XM_084317) is another VGAM2399 host target gene. LOC170372 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC170372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170372 BINDING SITE, designated SEQ ID:37538, to the nucleotide sequence of VGAM2399 RNA, herein designated VGAM RNA, also designated SEQ ID:5110.

[81380] Another function of VGAM2399 is therefore inhibition of LOC170372 (Accession XM_084317). Accordingly, utilities of VGAM2399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170372. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2400 (VGAM2400) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81381] VGAM2400 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2400 was detected is described hereinabove with reference to Figs. 1-8.

[81382] VGAM2400 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2400 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81383] VGAM2400 gene encodes a VGAM2400 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2400 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2400 precursor RNA is designated SEQ ID:2386, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2386 is located at position 89837 relative to the genome of Goatpox Virus.

[81384] VGAM2400 precursor RNA folds onto itself, forming VGAM2400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81385] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2400 folded precursor RNA into VGAM2400 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2400 RNA is designated SEQ ID:5111, and is provided hereinbelow with reference to the sequence listing part.

[81386] VGAM2400 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2400 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2400 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81387] VGAM2400 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2400 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2400 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2400 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2400 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81388] The complementary binding of VGAM2400 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2400 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2400 host target RNA into VGAM2400 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81389] It is appreciated that VGAM2400 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2400 host target genes. The mRNA of each one of this plurality of VGAM2400 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2400 RNA, herein designated VGAM RNA, and which when bound by VGAM2400 RNA causes inhibition of translation of respective one or more

VGAM2400 host target proteins.

[81390] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2400 gene, herein designated VGAM GENE, on one or more VGAM2400 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81391] It is yet further appreciated that a function of VGAM2400 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2400 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific

functions, and accordingly utilities, of VGAM2400 correlate with, and may be deduced from, the identity of the host target genes which VGAM2400 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81392] Nucleotide sequences of the VGAM2400 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2400 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2400 are further described hereinbelow with reference to Table 1.

[81393] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2400 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2400 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81394] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2400 gene, herein designated VGAM is inhibition of expression of VGAM2400 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2400 correlate with, and may be deduced from, the identity of the target genes which VGAM2400 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81395] Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM_056815) is a VGAM2400 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36429, to the nucleotide sequence of VGAM2400 RNA, herein designated VGAM RNA, also designated SEQ ID:5111.

[81396] A function of VGAM2400 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM_056815), a gene which has similarity to Drosophila dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM2400 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of

PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2401 (VGAM2401) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81397] VGAM2401 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2401 was detected is described hereinabove with reference to Figs. 1-8.

[81398] VGAM2401 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2401 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81399] VGAM2401 gene encodes a VGAM2401 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2401 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2401 precursor RNA is designated SEQ ID:2387, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2387 is located at position 109414 relative to the genome of Goatpox Virus.

[81400] VGAM2401 precursor RNA folds onto itself, forming VGAM2401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81401] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2401 folded precursor RNA into VGAM2401 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2401 RNA is designated SEQ ID:5112, and

is provided hereinbelow with reference to the sequence listing part.

[81402] VGAM2401 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2401 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2401 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81403] VGAM2401 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2401 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2401 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2401 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2401 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81404] The complementary binding of VGAM2401 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2401 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2401 host target RNA into VGAM2401 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81405] It is appreciated that VGAM2401 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2401 host target genes. The mRNA of each one of this plurality of VGAM2401 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2401 RNA, herein designated VGAM RNA, and which when bound by VGAM2401 RNA causes inhibition of translation of respective one or more VGAM2401 host target proteins.

[81406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2401 gene, herein designated VGAM GENE, on one or more VGAM2401 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81407] It is yet further appreciated that a function of VGAM2401 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2401 correlate with, and may be deduced from, the identity of the host target genes which VGAM2401 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81408] Nucleotide sequences of the VGAM2401 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2401 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2401 are further described hereinbelow with reference to Table 1.

[81409] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2401 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2401 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81410] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2401 gene, herein designated VGAM is inhibition of expression of VGAM2401 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2401 correlate with, and may be deduced from, the identity of the target genes which VGAM2401 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81411] ATP Synthase, H+ Transporting, Mitochondrial F1 Complex, Beta Polypeptide (ATP5B, Accession XM_006710) is a VGAM2401 host target gene. ATP5B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ATP5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP5B BINDING SITE, designated SEQ ID:30006, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81412] A function of VGAM2401 is therefore inhibition of ATP Synthase, H+ Transporting, Mitochondrial F1 Complex, Beta Polypeptide (ATP5B, Accession XM_006710). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with ATP5B. Cadherin, EGF LAG Seven-pass G-type Receptor 3 (flamingo homolog, Drosophila) (CELSR3, Accession NM_001407) is another VGAM2401 host target gene. CELSR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CELSR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR3 BINDING SITE, designated SEQ ID:7102, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81413] Another function of VGAM2401 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 3 (flamingo homolog, Drosophila) (CELSR3, Accession NM_001407), a gene which interacts in a homophilic manner in connecting cells. Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR3. The function of CELSR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM893.Epidermal Growth Factor Receptor

Pathway Substrate 15 (EPS15, Accession NM_001981) is another VGAM2401 host target gene. EPS15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPS15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPS15 BINDING SITE, designated SEQ ID:7711, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81414] Another function of VGAM2401 is therefore inhibition of Epidermal Growth Factor Receptor Pathway Substrate 15 (EPS15, Accession NM_001981), a gene which involved in cell growth regulation. Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPS15. The function of EPS15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.Interleukin 4 Receptor (IL4R, Accession NM_000418) is another VGAM2401 host target gene. IL4R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL4R, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL4R BINDING SITE, designated SEQ ID:6000, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81415] Another function of VGAM2401 is therefore inhibition of Interleukin 4 Receptor (IL4R, Accession NM_000418), a gene which may represent a regulatory molecule specific for il-4-dependent immune responses. Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL4R. The function of IL4R has been established by previous studies. Interleukin-4 (IL4; 147780) plays a major role in immunoglobulin E (IgE) production. Its signal is conferred to effector cells through binding to the alpha chain of the IL4 receptor (IL4RA). Caggana et al. (1999) examined the frequency of the IL4R sequence variants gly551 to arg and ile50 to val in 4 anonymous New York state populations defined by ethnic origin. These variants were studied because they are associated with atopy or atopic asthma, the prevalence of which varies in different populations. Methods were developed to detect both

polymorphisms in 855 newborn screening specimens. The arg551 allele was found most frequently in blacks (allele frequency of 68%), whereas the ile50 allele was most common in whites (allele frequency of 87%). Significantly more blacks had chromosomes bearing both of the 'enhanced-signaling' variants (ile50/arg551). Since enhanced IL4R signaling is associated with increased IgE production (atopy), Caggana et al. (1999) interpreted their data as suggesting that African-American populations may be at increased risk for diseases, including asthma, that are associated with atopy. The data pointed to the importance of determining the frequencies of single-nucleotide polymorphisms in different populations before drawing conclusions from allele association studies, since the background allele frequencies may be disparate. A genomewide screen for atopy susceptibility alleles in the Hutterites, a founder population of European origin living mainly in Canada, provided evidence for linkage to 16p (Ober et al., 1999). Ober et al. (2000) examined the IL4RA gene as the 16p-linked susceptibility locus. The Hutterites and outbred white, black, and Hispanic families all showed evidence of association between variants in the IL4RA gene and atopy or asthma; however, the alleles or haplo-

types showing the strongest evidence differed between the groups.

[81416] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[81417] Caggana, M.; Walker, K.; Reilly, A. A.; Conroy, J. M.; Duva, S.; Walsh, A. C. : Population-based studies reveal differences in the allelic frequencies of two functionally significant human interleukin-4 receptor polymorphisms in several ethnic groups. Genet. Med. 1: 267-271, 1999. ; and

[81418] Ober, C.; Leavitt, S. A.; Tsalenko, A.; Howard, T. D.; Hoki, D. M.; Daniel, R.; Newman, D. L.; Wu, X.; Parry, R.; Lester, L. A.; Solway, J.; Blumenthal, M.; King, R. A.; Xu, J.; Meyers.

[81419] Further studies establishing the function and utilities of IL4R are found in John Hopkins OMIM database record ID 147781, and in sited publications numbered 11337-11338, 11595-11596, 688, 11597, 11598, 11599-1160 and 11592 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Integrin, Alpha M (complement component receptor 3, alpha; also known as CD11b (p170), Macrophage Antigen Alpha Polypeptide) (ITGAM, Accession NM_000632) is another VGAM2401 host target gene. ITGAM BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAM BINDING SITE, designated SEQ ID:6248, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81420] Another function of VGAM2401 is therefore inhibition of Integrin, Alpha M (complement component receptor 3, alpha; also known as CD11b (p170), Macrophage Antigen Alpha Polypeptide) (ITGAM, Accession NM_000632), a gene which is invovled in various adhesive interactions of monocytes, macrophages and granulocytes as well as in mediating the uptake of complement-coated particles. Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAM. The function of ITGAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1386.SPS2 (Accession NM_012248) is another VGAM2401 host target gene. SPS2 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by SPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPS2 BINDING SITE, designated SEQ ID:14554, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81421] Another function of VGAM2401 is therefore inhibition of SPS2 (Accession NM_012248), a gene which synthesizes selenophosphate from selenide and ATP. Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPS2. The function of SPS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1754.Stanniocalcin 1 (STC1, Accession NM_003155) is another VGAM2401 host target gene. STC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STC1 BINDING SITE, designated SEQ ID:9135,

to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81422] Another function of VGAM2401 is therefore inhibition of Stanniocalcin 1 (STC1, Accession NM_003155), a gene which stimulates renal phosphate reabsorption, and could therefore prevent hypercalcemia. Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STC1. The function of STC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM623.T-cell Leukemia Translocation Altered Gene (TCTA, Accession NM_022171) is another VGAM2401 host target gene. TCTA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TCTA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCTA BINDING SITE, designated SEQ ID:22729, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81423] Another function of VGAM2401 is therefore inhibition of

T-cell Leukemia Translocation Altered Gene (TCTA, Accession NM_022171). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCTA. Triadin (TRDN, Accession NM_006073) is another VGAM2401 host target gene. TRDN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRDN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRDN BINDING SITE, designated SEQ ID:12717, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81424] Another function of VGAM2401 is therefore inhibition of Triadin (TRDN, Accession NM_006073). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRDN. Activin A Receptor, Type II (ACVR2, Accession NM_001616) is another VGAM2401 host target gene. ACVR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACVR2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACVR2 BINDING SITE, designated SEQ ID:7320, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81425] Another function of VGAM2401 is therefore inhibition of Activin A Receptor, Type II (ACVR2, Accession NM_001616). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACVR2. A Kinase (PRKA) Anchor Protein (gravin) 12 (AKAP12, Accession NM_005100) is another VGAM2401 host target gene. AKAP12 BINDING SITE1 and AKAP12 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AKAP12, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP12 BINDING SITE1 and AKAP12 BINDING SITE2, designated SEQ ID:11573 and SEQ ID:29314 respectively, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81426] Another function of VGAM2401 is therefore inhibition of A Kinase (PRKA) Anchor Protein (gravin) 12 (AKAP12, Accession NM_005100). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP12. FLJ20154 (Accession XM_053688) is another VGAM2401 host target gene. FLJ20154 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20154 BINDING SITE, designated SEQ ID:36105, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81427] Another function of VGAM2401 is therefore inhibition of FLJ20154 (Accession XM_053688). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20154. FLJ21616 (Accession NM_024567) is another VGAM2401 host target gene. FLJ21616 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21616, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21616 BINDING SITE, designated SEQ ID:23794, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81428] Another function of VGAM2401 is therefore inhibition of FLJ21616 (Accession NM_024567). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21616. FLJ22009 (Accession XM_015700) is another VGAM2401 host target gene. FLJ22009 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22009 BINDING SITE, designated SEQ ID:30242, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81429] Another function of VGAM2401 is therefore inhibition of FLJ22009 (Accession XM_015700). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ22009. GNB4 (Accession NM_021629) is another VGAM2401 host target gene. GNB4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNB4 BINDING SITE, designated SEQ ID:22271, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81430] Another function of VGAM2401 is therefore inhibition of GNB4 (Accession NM_021629). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB4. KIAA0630 (Accession XM_114729) is another VGAM2401 host target gene. KIAA0630 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0630 BINDING SITE, designated SEQ ID:43066, to the nucleotide sequence of

VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81431] Another function of VGAM2401 is therefore inhibition of KIAA0630 (Accession XM_114729). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0630. KIAA0680 (Accession NM_014721) is another VGAM2401 host target gene. KIAA0680 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0680, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0680 BINDING SITE, designated SEQ ID:16283, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81432] Another function of VGAM2401 is therefore inhibition of KIAA0680 (Accession NM_014721). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0680. KIAA0716 (Accession NM_014705) is another VGAM2401 host target gene. KIAA0716 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA0716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0716 BINDING SITE, designated SEQ ID:16246, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81433] Another function of VGAM2401 is therefore inhibition of KIAA0716 (Accession NM_014705). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0716. KIAA0953 (Accession XM_039733) is another VGAM2401 host target gene. KIAA0953 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0953, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0953 BINDING SITE, designated SEQ ID:33171, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81434] Another function of VGAM2401 is therefore inhibition of KIAA0953 (Accession XM_039733). Accordingly, utilities

of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0953. KIAA1319 (Accession NM_020770) is another VGAM2401 host target gene. KIAA1319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1319 BINDING SITE, designated SEQ ID:21866, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81435] Another function of VGAM2401 is therefore inhibition of KIAA1319 (Accession NM_020770). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1319. KIAA1361 (Accession XM_030845) is another VGAM2401 host target gene. KIAA1361 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1361 BINDING SITE, designated SEQ ID:31172, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81436] Another function of VGAM2401 is therefore inhibition of KIAA1361 (Accession XM_030845). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1361. KIAA1719 (Accession XM_042936) is another VGAM2401 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33825, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81437] Another function of VGAM2401 is therefore inhibition of KIAA1719 (Accession XM_042936). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719. NCK Adaptor Protein 1 (NCK1, Accession NM_006153) is another VGAM2401 host target gene.

NCK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCK1 BINDING SITE, designated SEQ ID:12808, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81438] Another function of VGAM2401 is therefore inhibition of NCK Adaptor Protein 1 (NCK1, Accession NM_006153). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCK1. PRO1866 (Accession NM_018510) is another VGAM2401 host target gene. PRO1866 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1866 BINDING SITE, designated SEQ ID:20579, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81439] Another function of VGAM2401 is therefore inhibition of PRO1866 (Accession NM_018510). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1866. LOC148697 (Accession XM_086276) is another VGAM2401 host target gene. LOC148697 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148697 BINDING SITE, designated SEQ ID:38575, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81440] Another function of VGAM2401 is therefore inhibition of LOC148697 (Accession XM_086276). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148697. LOC154215 (Accession XM_087875) is another VGAM2401 host target gene. LOC154215 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154215, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154215 BINDING SITE, designated SEQ ID:39465, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81441] Another function of VGAM2401 is therefore inhibition of LOC154215 (Accession XM_087875). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154215. LOC205418 (Accession XM_119792) is another VGAM2401 host target gene. LOC205418 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC205418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205418 BINDING SITE, designated SEQ ID:43597, to the nucleotide sequence of VGAM2401 RNA, herein designated VGAM RNA, also designated SEQ ID:5112.

[81442] Another function of VGAM2401 is therefore inhibition of LOC205418 (Accession XM_119792). Accordingly, utilities of VGAM2401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC205418. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2402 (VGAM2402) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81443] VGAM2402 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2402 was detected is described hereinabove with reference to Figs. 1-8.

[81444] VGAM2402 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2402 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81445] VGAM2402 gene encodes a VGAM2402 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2402 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2402 precursor RNA is designated SEQ ID:2388, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2388 is located at position 702 relative to the genome of Goatpox Virus.

[81446] VGAM2402 precursor RNA folds onto itself, forming VGAM2402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81447] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2402 folded precursor RNA into VGAM2402 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2402 RNA is designated SEQ ID:5113, and is provided hereinbelow with reference to the sequence listing part.

[81448] VGAM2402 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2402 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2402 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81449] VGAM2402 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2402 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2402 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2402 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2402 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81450] The complementary binding of VGAM2402 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2402 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2402 host target RNA into VGAM2402 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81451] It is appreciated that VGAM2402 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2402 host target genes. The mRNA of each one of this plurality of VGAM2402 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2402 RNA, herein designated VGAM RNA, and which when bound by VGAM2402 RNA causes

inhibition of translation of respective one or more VGAM2402 host target proteins.

[81452] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2402 gene, herein designated VGAM GENE, on one or more VGAM2402 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81453] It is yet further appreciated that a function of VGAM2402 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2402 include diagnosis, prevention and

treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2402 correlate with, and may be deduced from, the identity of the host target genes which VGAM2402 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81454] Nucleotide sequences of the VGAM2402 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2402 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2402 are further described hereinbelow with reference to Table 1.

[81455] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2402 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2402 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81456] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2402 gene, herein designated VGAM is inhibition of expression of VGAM2402 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2402 correlate with, and may be deduced from, the identity of the target genes which VGAM2402 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81457] Protocadherin 11 X-linked (PCDH11X, Accession NM_032968) is a VGAM2402 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26787 and SEQ ID:26802 respectively, to the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, also designated SEQ ID:5113.

[81458] A function of VGAM2402 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM2402 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.Solute Carrier Family 25 (mitochondrial carrier; ornithine transporter) Member 15 (SLC25A15, Accession NM_014252) is another VGAM2402 host target gene. SLC25A15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC25A15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC25A15 BINDING SITE, designated SEQ ID:15525, to the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, also designated SEQ ID:5113.

[81459] Another function of VGAM2402 is therefore inhibition of Solute Carrier Family 25 (mitochondrial carrier; ornithine transporter) Member 15 (SLC25A15, Accession NM_014252), a gene which participates theornithine transport across inner mitochondrial membrane, from the cytoplasm to the matrix. Accordingly, utilities of VGAM2402 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SLC25A15. The function of SLC25A15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.Baculoviral IAP Repeat-containing 5 (survivin) (BIRC5, Accession NM_001168) is another VGAM2402 host target gene. BIRC5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIRC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC5 BINDING SITE, designated SEQ ID:6835, to the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, also designated SEQ ID:5113.

[81460] Another function of VGAM2402 is therefore inhibition of Baculoviral IAP Repeat-containing 5 (survivin) (BIRC5, Accession NM_001168). Accordingly, utilities of VGAM2402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC5. Carbohydrate (chondroitin) Synthase 1 (CHSY1, Accession NM_014918) is another VGAM2402 host target gene. CHSY1 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by CHSY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHSY1 BINDING SITE, designated SEQ ID:17170, to the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, also designated SEQ ID:5113.

[81461] Another function of VGAM2402 is therefore inhibition of Carbohydrate (chondroitin) Synthase 1 (CHSY1, Accession NM_014918). Accordingly, utilities of VGAM2402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHSY1. DKFZP434P0721 (Accession XM_033181) is another VGAM2402 host target gene. DKFZP434P0721 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0721 BINDING SITE, designated SEQ ID:31868, to the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, also designated SEQ ID:5113.

[81462] Another function of VGAM2402 is therefore inhibition of DKFZP434P0721 (Accession XM_033181). Accordingly, utilities of VGAM2402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0721. KIAA1336 (Accession XM_051306) is another VGAM2402 host target gene. KIAA1336 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1336 BINDING SITE, designated SEQ ID:35800, to the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, also designated SEQ ID:5113.

[81463] Another function of VGAM2402 is therefore inhibition of KIAA1336 (Accession XM_051306). Accordingly, utilities of VGAM2402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1336. Period Homolog 3 (Drosophila) (PER3, Accession NM_016831) is another VGAM2402 host target gene. PER3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PER3, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER3 BINDING SITE, designated SEQ ID:18821, to the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, also designated SEQ ID:5113.

[81464] Another function of VGAM2402 is therefore inhibition of Period Homolog 3 (Drosophila) (PER3, Accession NM_016831). Accordingly, utilities of VGAM2402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER3. SS-56 (Accession XM_006063) is another VGAM2402 host target gene. SS-56 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SS-56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS-56 BINDING SITE, designated SEQ ID:29987, to the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, also designated SEQ ID:5113.

[81465] Another function of VGAM2402 is therefore inhibition of SS-56 (Accession XM_006063). Accordingly, utilities of VGAM2402 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SS-56. LOC148195 (Accession XM_097419) is another VGAM2402 host target gene. LOC148195 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:40871, to the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, also designated SEQ ID:5113.

[81466] Another function of VGAM2402 is therefore inhibition of LOC148195 (Accession XM_097419). Accordingly, utilities of VGAM2402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195. LOC152503 (Accession XM_098238) is another VGAM2402 host target gene. LOC152503 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152503 BINDING SITE, designated SEQ ID:41515, to

the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, also designated SEQ ID:5113.

[81467] Another function of VGAM2402 is therefore inhibition of LOC152503 (Accession XM_098238). Accordingly, utilities of VGAM2402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152503. LOC51580 (Accession NM_015874) is another VGAM2402 host target gene. LOC51580 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51580 BINDING SITE, designated SEQ ID:18015, to the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, also designated SEQ ID:5113.

[81468] Another function of VGAM2402 is therefore inhibition of LOC51580 (Accession NM_015874). Accordingly, utilities of VGAM2402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51580. LOC90906 (Accession XM_034809) is another VGAM2402 host target gene. LOC90906 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC90906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:32146, to the nucleotide sequence of VGAM2402 RNA, herein designated VGAM RNA, also designated SEQ ID:5113.

[81469] Another function of VGAM2402 is therefore inhibition of LOC90906 (Accession XM_034809). Accordingly, utilities of VGAM2402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2403 (VGAM2403) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81470] VGAM2403 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2403 was detected is described hereinabove with reference to Figs. 1-8.

[81471] VGAM2403 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Goatpox Virus. VGAM2403 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81472] VGAM2403 gene encodes a VGAM2403 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2403 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2403 precursor RNA is designated SEQ ID:2389, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2389 is located at position 52365 relative to the genome of Goatpox Virus.

[81473] VGAM2403 precursor RNA folds onto itself, forming VGAM2403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81474] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2403 folded precursor RNA into VGAM2403 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM2403 RNA is designated SEQ ID:5114, and is provided hereinbelow with reference to the sequence listing part.

[81475] VGAM2403 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2403 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2403 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81476] VGAM2403 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2403 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2403 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2403 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2403 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81477] The complementary binding of VGAM2403 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2403 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2403

host target RNA into VGAM2403 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81478] It is appreciated that VGAM2403 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2403 host target genes. The mRNA of each one of this plurality of VGAM2403 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2403 RNA, herein designated VGAM RNA, and which when bound by VGAM2403 RNA causes inhibition of translation of respective one or more VGAM2403 host target proteins.

[81479] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2403 gene, herein designated VGAM GENE, on one or more VGAM2403 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81480] It is yet further appreciated that a function of VGAM2403 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2403 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2403 correlate with, and may be deduced from, the identity of the host target genes which VGAM2403 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81481] Nucleotide sequences of the VGAM2403 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2403 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2403 are further

described hereinbelow with reference to Table 1.

[81482] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2403 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2403 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81483] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2403 gene, herein designated VGAM is inhibition of expression of VGAM2403 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2403 correlate with, and may be deduced from, the identity of the target genes which VGAM2403 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81484] Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM_005629) is a VGAM2403 host target gene. SLC6A8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC6A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SLC6A8 BINDING SITE, designated SEQ ID:12145, to the nucleotide sequence of VGAM2403 RNA, herein designated VGAM RNA, also designated SEQ ID:5114.

[81485] A function of VGAM2403 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM_005629). Accordingly, utilities of VGAM2403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A8. FLJ20291 (Accession NM_017748) is another VGAM2403 host target gene. FLJ20291 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20291, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20291 BINDING SITE, designated SEQ ID:19341, to the nucleotide sequence of VGAM2403 RNA, herein designated VGAM RNA, also designated SEQ ID:5114.

[81486] Another function of VGAM2403 is therefore inhibition of FLJ20291 (Accession NM_017748). Accordingly, utilities of VGAM2403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20291. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2404 (VGAM2404) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81487] VGAM2404 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2404 was detected is described hereinabove with reference to Figs. 1-8.

[81488] VGAM2404 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2404 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81489] VGAM2404 gene encodes a VGAM2404 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2404 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2404 precursor RNA is designated SEQ ID:2390, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2390 is located at position 65726 relative to the genome of Goatpox Virus.

[81490] VGAM2404 precursor RNA folds onto itself, forming VGAM2404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81491] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2404 folded precursor RNA into VGAM2404 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2404 RNA is designated SEQ ID:5115, and is provided hereinbelow with reference to the sequence listing part.

[81492] VGAM2404 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2404 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2404 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81493] VGAM2404 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2404 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2404 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2404 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2404 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81494] The complementary binding of VGAM2404 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2404 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2404 host target RNA into VGAM2404 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81495] It is appreciated that VGAM2404 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2404 host target genes. The mRNA of each one of this plurality of VGAM2404 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2404 RNA, herein designated VGAM RNA, and which when bound by VGAM2404 RNA causes

inhibition of translation of respective one or more VGAM2404 host target proteins.

[81496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2404 gene, herein designated VGAM GENE, on one or more VGAM2404 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81497] It is yet further appreciated that a function of VGAM2404 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2404 include diagnosis, prevention and

treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2404 correlate with, and may be deduced from, the identity of the host target genes which VGAM2404 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81498] Nucleotide sequences of the VGAM2404 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2404 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2404 are further described hereinbelow with reference to Table 1.

[81499] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2404 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2404 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81500] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2404 gene, herein designated VGAM is inhibition of expression of VGAM2404 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2404 correlate with, and may be deduced from, the identity of the target genes which VGAM2404 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81501] DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 20, 103kDa (DDX20, Accession NM_007204) is a VGAM2404 host target gene. DDX20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDX20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX20 BINDING SITE, designated SEQ ID:14066, to the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, also designated SEQ ID:5115.

[81502] A function of VGAM2404 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 20, 103kDa (DDX20, Accession NM_007204), a gene which interacts with SMN and is required for pre-mRNA splicing in the nucleus. Accordingly, utilities of VGAM2404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX20. The function of DDX20

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1929.Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM_006283) is another VGAM2404 host target gene. TACC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TACC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACC1 BINDING SITE, designated SEQ ID:12965, to the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, also designated SEQ ID:5115.

[81503] Another function of VGAM2404 is therefore inhibition of Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM_006283). Accordingly, utilities of VGAM2404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACC1. DnaJ (Hsp40) Homolog, Subfamily A, Member 2 (DNAJA2, Accession XM_007963) is another VGAM2404 host target gene. DNAJA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

DNAJA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJA2 BINDING SITE, designated SEQ ID:30068, to the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, also designated SEQ ID:5115.

[81504] Another function of VGAM2404 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily A, Member 2 (DNAJA2, Accession XM_007963). Accordingly, utilities of VGAM2404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJA2. FLJ12888 (Accession NM_024945) is another VGAM2404 host target gene. FLJ12888 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12888 BINDING SITE, designated SEQ ID:24496, to the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, also designated SEQ ID:5115.

[81505] Another function of VGAM2404 is therefore inhibition of

FLJ12888 (Accession NM_024945). Accordingly, utilities of VGAM2404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12888. KIAA0205 (Accession NM_014873) is another VGAM2404 host target gene. KIAA0205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0205 BINDING SITE, designated SEQ ID:17007, to the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, also designated SEQ ID:5115.

[81506] Another function of VGAM2404 is therefore inhibition of KIAA0205 (Accession NM_014873). Accordingly, utilities of VGAM2404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0205. KIAA0332 (Accession XM_031553) is another VGAM2404 host target gene. KIAA0332 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0332 BINDING SITE, designated SEQ ID:31415, to the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, also designated SEQ ID:5115.

[81507] Another function of VGAM2404 is therefore inhibition of KIAA0332 (Accession XM_031553). Accordingly, utilities of VGAM2404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0332. Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM_010230) is another VGAM2404 host target gene. NUDT11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUDT11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT11 BINDING SITE, designated SEQ ID:30142, to the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, also designated SEQ ID:5115.

[81508] Another function of VGAM2404 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM_010230). Accordingly, utilities of VGAM2404 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with NUDT11. PI4KII (Accession NM_018425) is another VGAM2404 host target gene. PI4KII BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PI4KII, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PI4KII BINDING SITE, designated SEQ ID:20483, to the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, also designated SEQ ID:5115.

[81509] Another function of VGAM2404 is therefore inhibition of PI4KII (Accession NM_018425). Accordingly, utilities of VGAM2404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PI4KII. LOC152316 (Accession XM_098185) is another VGAM2404 host target gene. LOC152316 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152316 BINDING SITE, designated SEQ ID:41456, to

the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, also designated SEQ ID:5115.

[81510] Another function of VGAM2404 is therefore inhibition of LOC152316 (Accession XM_098185). Accordingly, utilities of VGAM2404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152316. LOC153259 (Accession XM_098342) is another VGAM2404 host target gene. LOC153259 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153259 BINDING SITE, designated SEQ ID:41602, to the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, also designated SEQ ID:5115.

[81511] Another function of VGAM2404 is therefore inhibition of LOC153259 (Accession XM_098342). Accordingly, utilities of VGAM2404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153259. LOC90488 (Accession XM_032129) is another VGAM2404 host target gene. LOC90488 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC90488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90488 BINDING SITE, designated SEQ ID:31558, to the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, also designated SEQ ID:5115.

[81512] Another function of VGAM2404 is therefore inhibition of LOC90488 (Accession XM_032129). Accordingly, utilities of VGAM2404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90488. LOC90750 (Accession XM_033868) is another VGAM2404 host target gene. LOC90750 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90750 BINDING SITE, designated SEQ ID:31968, to the nucleotide sequence of VGAM2404 RNA, herein designated VGAM RNA, also designated SEQ ID:5115.

[81513] Another function of VGAM2404 is therefore inhibition of LOC90750 (Accession XM_033868). Accordingly, utilities

of VGAM2404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90750. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2405 (VGAM2405) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81514] VGAM2405 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2405 was detected is described hereinabove with reference to Figs. 1-8.

[81515] VGAM2405 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2405 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81516] VGAM2405 gene encodes a VGAM2405 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2405 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2405 precursor RNA is designated SEQ ID:2391, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2391 is located at position 127713 relative to the genome of Goatpox Virus.

[81517] VGAM2405 precursor RNA folds onto itself, forming VGAM2405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81518] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2405 folded precursor RNA into VGAM2405 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2405 RNA is designated SEQ ID:5116, and

is provided hereinbelow with reference to the sequence listing part.

[81519] VGAM2405 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2405 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2405 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81520] VGAM2405 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2405 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2405 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2405 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2405 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81521] The complementary binding of VGAM2405 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2405 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2405 host target RNA into VGAM2405 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81522] It is appreciated that VGAM2405 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2405 host target genes. The mRNA of each one of this plurality of VGAM2405 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2405 RNA, herein designated VGAM RNA, and which when bound by VGAM2405 RNA causes inhibition of translation of respective one or more VGAM2405 host target proteins.

[81523] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2405 gene, herein designated VGAM GENE, on one or more VGAM2405 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81524] It is yet further appreciated that a function of VGAM2405 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2405 correlate with, and may be deduced from, the identity of the host target genes which VGAM2405 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81525] Nucleotide sequences of the VGAM2405 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2405 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2405 are further described hereinbelow with reference to Table 1.

[81526] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2405 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2405 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81527] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2405 gene, herein designated VGAM is inhibition of expression of VGAM2405 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2405 correlate with, and may be deduced from, the identity of the target genes which VGAM2405 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81528] Carbohydrate Kinase-like (CARKL, Accession NM_013276) is a VGAM2405 host target gene. CARKL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CARKL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARKL BINDING SITE, designated SEQ ID:14939, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81529] A function of VGAM2405 is therefore inhibition of Carbohydrate Kinase-like (CARKL, Accession NM_013276), a gene which is a putative carbohydrate kinase and may be a modifier for the cystinosis phenotype. Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with CARKL. The function of CARKL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419.Cell Division Cycle 25B (CDC25B, Accession NM_021873) is another VGAM2405 host target gene. CDC25B BINDING SITE1 and CDC25B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CDC25B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC25B BINDING SITE1 and CDC25B BINDING SITE2, designated SEQ ID:22414 and SEQ ID:22418 respectively, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81530] Another function of VGAM2405 is therefore inhibition of Cell Division Cycle 25B (CDC25B, Accession NM_021873), a gene which is positively activated by dephosphorylation. Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC25B. The function of CDC25B and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM165.Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM_000103) is another VGAM2405 host target gene. CYP19 BINDING SITE1 and CYP19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CYP19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP19 BINDING SITE1 and CYP19 BINDING SITE2, designated SEQ ID:5562 and SEQ ID:13531 respectively, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81531] Another function of VGAM2405 is therefore inhibition of Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM_000103), a gene which catalyzes the last steps of estrogen biosynthesis. Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP19. The function of CYP19 and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

inabove with reference to VGAM508.Membrane-spanning 4-domains, Subfamily A, Member 4 (MS4A4A, Accession NM_024021) is another VGAM2405 host target gene. MS4A4A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MS4A4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A4A BINDING SITE, designated SEQ ID:23449, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81532] Another function of VGAM2405 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 4 (MS4A4A, Accession NM_024021), a gene which binds to the fc region of immunoglobulins epsilon. high affinity receptor. initiating the allergic response. Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A4A. The function of MS4A4A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329.C-myc Binding Protein

(MYCBP, Accession NM_012333) is another VGAM2405 host target gene. MYCBP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYCBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCBP BINDING SITE, designated SEQ ID:14726, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81533] Another function of VGAM2405 is therefore inhibition of C-myc Binding Protein (MYCBP, Accession NM_012333), a gene which binds c-Myc stimulating the activation of E-box-dependent transcription. Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCBP. The function of MYCBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM435.Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM_006452) is another VGAM2405 host target gene. PAICS BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by PAICS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAICS BINDING SITE, designated SEQ ID:13167, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81534] Another function of VGAM2405 is therefore inhibition of Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM_006452), a gene which is required for purine biosynthesis. Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAICS. The function of PAICS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894.PRV1 (Accession XM_056490) is another VGAM2405 host target gene. PRV1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRV1 BINDING SITE, designated SEQ ID:36397, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81535] Another function of VGAM2405 is therefore inhibition of PRV1 (Accession XM_056490), a gene which may function as a hematopoietic receptor. Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRV1. The function of PRV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM778.Visinin-like 1 (VSNL1, Accession NM_003385) is another VGAM2405 host target gene. VSNL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VSNL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VSNL1 BINDING SITE, designated SEQ ID:9415, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81536] Another function of VGAM2405 is therefore inhibition of Visinin-like 1 (VSNL1, Accession NM_003385). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VSNL1. Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083) is another VGAM2405 host target gene. XK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XK BINDING SITE, designated SEQ ID:22055, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81537] Another function of VGAM2405 is therefore inhibition of Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XK. Zinc Finger Protein 202 (ZNF202, Accession NM_003455) is another VGAM2405 host target gene. ZNF202 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by ZNF202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF202 BINDING SITE, designated SEQ ID:9511, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81538] Another function of VGAM2405 is therefore inhibition of Zinc Finger Protein 202 (ZNF202, Accession NM_003455). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF202. Chromosome 21 Open Reading Frame 42 (C21orf42, Accession NM_058184) is another VGAM2405 host target gene. C21orf42 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C21orf42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf42 BINDING SITE, designated SEQ ID:27751, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81539] Another function of VGAM2405 is therefore inhibition of

Chromosome 21 Open Reading Frame 42 (C21orf42, Accession NM_058184). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf42. Cyclin M4 (CNNM4, Accession NM_020184) is another VGAM2405 host target gene. CNNM4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNNM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM4 BINDING SITE, designated SEQ ID:21423, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81540] Another function of VGAM2405 is therefore inhibition of Cyclin M4 (CNNM4, Accession NM_020184). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM4. CPEB1 (Accession NM_030594) is another VGAM2405 host target gene. CPEB1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CPEB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPEB1 BINDING SITE, designated SEQ ID:24960, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81541] Another function of VGAM2405 is therefore inhibition of CPEB1 (Accession NM_030594). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPEB1. DKFZP434G1415 (Accession NM_031292) is another VGAM2405 host target gene. DKFZP434G1415 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434G1415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434G1415 BINDING SITE, designated SEQ ID:25316, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81542] Another function of VGAM2405 is therefore inhibition of DKFZP434G1415 (Accession NM_031292). Accordingly, utilities of VGAM2405 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP434G1415. DKFZP564D0462 (Accession XM_047080) is another VGAM2405 host target gene. DKFZP564D0462 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564D0462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D0462 BINDING SITE, designated SEQ ID:34896, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81543] Another function of VGAM2405 is therefore inhibition of DKFZP564D0462 (Accession XM_047080). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D0462. DKFZp761F2014 (Accession NM_020215) is another VGAM2405 host target gene. DKFZp761F2014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761F2014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZp761F2014 BINDING SITE, designated SEQ ID:21461, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81544] Another function of VGAM2405 is therefore inhibition of DKFZp761F2014 (Accession NM_020215). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761F2014. FLJ10830 (Accession NM_018235) is another VGAM2405 host target gene. FLJ10830 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10830 BINDING SITE, designated SEQ ID:20183, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81545] Another function of VGAM2405 is therefore inhibition of FLJ10830 (Accession NM_018235). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10830. FLJ14753 (Accession NM_032558) is another

VGAM2405 host target gene. FLJ14753 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14753 BINDING SITE, designated SEQ ID:26286, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81546] Another function of VGAM2405 is therefore inhibition of FLJ14753 (Accession NM_032558). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14753. FLJ20195 (Accession NM_017706) is another VGAM2405 host target gene. FLJ20195 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20195 BINDING SITE, designated SEQ ID:19282, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81547] Another function of VGAM2405 is therefore inhibition of FLJ20195 (Accession NM_017706). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20195. Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM_001470) is another VGAM2405 host target gene. GABBR1 BINDING SITE1 and GABBR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GABBR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE1 and GABBR1 BINDING SITE2, designated SEQ ID:7207 and SEQ ID:22425 respectively, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81548] Another function of VGAM2405 is therefore inhibition of Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM_001470). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1. Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654) is another VGAM2405 host target gene.

SDC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16092, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81549] Another function of VGAM2405 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. Zinc Finger Protein 297B (ZNF297B, Accession NM_014007) is another VGAM2405 host target gene. ZNF297B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF297B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF297B BINDING SITE, designated SEQ ID:15219, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81550] Another function of VGAM2405 is therefore inhibition of Zinc Finger Protein 297B (ZNF297B, Accession NM_014007). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF297B. LOC133418 (Accession XM_059649) is another VGAM2405 host target gene. LOC133418 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC133418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133418 BINDING SITE, designated SEQ ID:37042, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81551] Another function of VGAM2405 is therefore inhibition of LOC133418 (Accession XM_059649). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133418. LOC143173 (Accession XM_016685) is another VGAM2405 host target gene. LOC143173 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143173, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143173 BINDING SITE, designated SEQ ID:30274, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81552] Another function of VGAM2405 is therefore inhibition of LOC143173 (Accession XM_016685). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143173. LOC148811 (Accession XM_086326) is another VGAM2405 host target gene. LOC148811 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148811 BINDING SITE, designated SEQ ID:38601, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81553] Another function of VGAM2405 is therefore inhibition of LOC148811 (Accession XM_086326). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC148811. LOC152018 (Accession XM_098156) is another VGAM2405 host target gene. LOC152018 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152018 BINDING SITE, designated SEQ ID:41422, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81554] Another function of VGAM2405 is therefore inhibition of LOC152018 (Accession XM_098156). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152018. LOC253639 (Accession XM_171060) is another VGAM2405 host target gene. LOC253639 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253639 BINDING SITE, designated SEQ ID:45855, to

the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81555] Another function of VGAM2405 is therefore inhibition of LOC253639 (Accession XM_171060). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253639. LOC91689 (Accession NM_033318) is another VGAM2405 host target gene. LOC91689 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91689, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91689 BINDING SITE, designated SEQ ID:27158, to the nucleotide sequence of VGAM2405 RNA, herein designated VGAM RNA, also designated SEQ ID:5116.

[81556] Another function of VGAM2405 is therefore inhibition of LOC91689 (Accession NM_033318). Accordingly, utilities of VGAM2405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91689. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2406 (VGAM2406) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81557] VGAM2406 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2406 was detected is described hereinabove with reference to Figs. 1-8.

[81558] VGAM2406 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2406 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81559] VGAM2406 gene encodes a VGAM2406 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2406 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2406 precursor RNA is designated SEQ ID:2392, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2392 is located at position 118549 relative to the genome of Goatpox Virus.

[81560] VGAM2406 precursor RNA folds onto itself, forming VGAM2406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81561] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2406 folded precursor RNA into VGAM2406 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2406 RNA is designated SEQ ID:5117, and is provided hereinbelow with reference to the sequence listing part.

[81562] VGAM2406 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2406 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2406 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81563] VGAM2406 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2406 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2406 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2406 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2406 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81564] The complementary binding of VGAM2406 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2406 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2406 host target RNA into VGAM2406 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81565] It is appreciated that VGAM2406 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2406 host target genes. The mRNA of each one of this plurality of VGAM2406 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2406 RNA, herein designated VGAM RNA, and which when bound by VGAM2406 RNA causes inhibition of translation of respective one or more VGAM2406 host target proteins.

[81566] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2406 gene, herein designated VGAM GENE, on one or more VGAM2406 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81567] It is yet further appreciated that a function of VGAM2406 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2406 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2406 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2406 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81568] Nucleotide sequences of the VGAM2406 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2406 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2406 are further described hereinbelow with reference to Table 1.

[81569] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2406 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2406 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81570] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2406 gene, herein designated VGAM is inhibition of expression of VGAM2406 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2406 correlate with, and may be deduced from, the identity of the target genes which VGAM2406

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81571] Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is a VGAM2406 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:44333, to the nucleotide sequence of VGAM2406 RNA, herein designated VGAM RNA, also designated SEQ ID:5117.

[81572] A function of VGAM2406 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM2406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.LOC153711 (Accession

XM_098419) is another VGAM2406 host target gene. LOC153711 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153711 BINDING SITE, designated SEQ ID:41667, to the nucleotide sequence of VGAM2406 RNA, herein designated VGAM RNA, also designated SEQ ID:5117.

[81573] Another function of VGAM2406 is therefore inhibition of LOC153711 (Accession XM_098419). Accordingly, utilities of VGAM2406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153711. LOC154442 (Accession XM_098536) is another VGAM2406 host target gene. LOC154442 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154442 BINDING SITE, designated SEQ ID:41704, to the nucleotide sequence of VGAM2406 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5117.

[81574] Another function of VGAM2406 is therefore inhibition of LOC154442 (Accession XM_098536). Accordingly, utilities of VGAM2406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154442. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2407 (VGAM2407) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81575] VGAM2407 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2407 was detected is described hereinabove with reference to Figs. 1-8.

[81576] VGAM2407 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2407 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81577] VGAM2407 gene encodes a VGAM2407 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2407 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2407 precursor RNA is designated SEQ ID:2393, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2393 is located at position 111620 relative to the genome of Goatpox Virus.

[81578] VGAM2407 precursor RNA folds onto itself, forming VGAM2407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81579] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2407 folded precursor RNA into VGAM2407 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2407 RNA is designated SEQ ID:5118, and is provided hereinbelow with reference to the sequence listing part.

[81580] VGAM2407 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2407 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2407 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81581] VGAM2407 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2407 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2407 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2407 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2407 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81582] The complementary binding of VGAM2407 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2407 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2407 host target RNA into VGAM2407 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81583] It is appreciated that VGAM2407 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2407 host target genes. The mRNA of

each one of this plurality of VGAM2407 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2407 RNA, herein designated VGAM RNA, and which when bound by VGAM2407 RNA causes inhibition of translation of respective one or more VGAM2407 host target proteins.

[81584] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2407 gene, herein designated VGAM GENE, on one or more VGAM2407 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[81585] It is yet further appreciated that a function of VGAM2407 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2407 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2407 correlate with, and may be deduced from, the identity of the host target genes which VGAM2407 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81586] Nucleotide sequences of the VGAM2407 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2407 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2407 are further described hereinbelow with reference to Table 1.

[81587] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2407 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2407 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81588] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2407 gene, herein designated VGAM is inhibition of expression of VGAM2407 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2407 correlate with, and may be deduced from, the identity of the target genes which VGAM2407 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81589] DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 11 (CHL1-like helicase homolog, S. cerevisiae) (DDX11, Accession NM_030655) is a VGAM2407 host target gene. DDX11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX11 BINDING SITE, designated SEQ ID:24985, to the nucleotide sequence of VGAM2407 RNA, herein designated VGAM RNA, also designated SEQ ID:5118.

[81590] A function of VGAM2407 is therefore inhibition of DEAD/

H (Asp-Glu-Ala-Asp/His) Box Polypeptide 11 (CHL1-like helicase homolog, S. cerevisiae) (DDX11, Accession NM_030655), a gene which could be an ATP-dependent DNA-binding helicase and may intervene in cell cycle regulation. Accordingly, utilities of VGAM2407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX11. The function of DDX11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1533.KIAA0836 (Accession XM_035390) is another VGAM2407 host target gene. KIAA0836 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0836 BINDING SITE, designated SEQ ID:32243, to the nucleotide sequence of VGAM2407 RNA, herein designated VGAM RNA, also designated SEQ ID:5118.

[81591] Another function of VGAM2407 is therefore inhibition of KIAA0836 (Accession XM_035390). Accordingly, utilities of VGAM2407 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0836. MGC2574 (Accession NM_024098) is another VGAM2407 host target gene. MGC2574 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2574 BINDING SITE, designated SEQ ID:23537, to the nucleotide sequence of VGAM2407 RNA, herein designated VGAM RNA, also designated SEQ ID:5118.

[81592] Another function of VGAM2407 is therefore inhibition of MGC2574 (Accession NM_024098). Accordingly, utilities of VGAM2407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2574. LOC133362 (Accession XM_068305) is another VGAM2407 host target gene. LOC133362 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC133362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133362 BINDING SITE, designated SEQ ID:37379, to

the nucleotide sequence of VGAM2407 RNA, herein designated VGAM RNA, also designated SEQ ID:5118.

[81593] Another function of VGAM2407 is therefore inhibition of LOC133362 (Accession XM_068305). Accordingly, utilities of VGAM2407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133362. LOC145078 (Accession XM_015840) is another VGAM2407 host target gene. LOC145078 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145078 BINDING SITE, designated SEQ ID:30247, to the nucleotide sequence of VGAM2407 RNA, herein designated VGAM RNA, also designated SEQ ID:5118.

[81594] Another function of VGAM2407 is therefore inhibition of LOC145078 (Accession XM_015840). Accordingly, utilities of VGAM2407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145078. LOC145676 (Accession XM_085202) is another VGAM2407 host target gene. LOC145676 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC145676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145676 BINDING SITE, designated SEQ ID:37920, to the nucleotide sequence of VGAM2407 RNA, herein designated VGAM RNA, also designated SEQ ID:5118.

[81595] Another function of VGAM2407 is therefore inhibition of LOC145676 (Accession XM_085202). Accordingly, utilities of VGAM2407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145676. LOC90459 (Accession XM_031826) is another VGAM2407 host target gene. LOC90459 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90459 BINDING SITE, designated SEQ ID:31490, to the nucleotide sequence of VGAM2407 RNA, herein designated VGAM RNA, also designated SEQ ID:5118.

[81596] Another function of VGAM2407 is therefore inhibition of LOC90459 (Accession XM_031826). Accordingly, utilities

of VGAM2407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90459. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2408 (VGAM2408) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81597] VGAM2408 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2408 was detected is described hereinabove with reference to Figs. 1-8.

[81598] VGAM2408 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2408 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81599] VGAM2408 gene encodes a VGAM2408 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2408 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2408 precursor RNA is designated SEQ ID:2394, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2394 is located at position 36819 relative to the genome of Goatpox Virus.

[81600] VGAM2408 precursor RNA folds onto itself, forming VGAM2408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81601] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2408 folded precursor RNA into VGAM2408 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2408 RNA is designated SEQ ID:5119, and

is provided hereinbelow with reference to the sequence listing part.

[81602] VGAM2408 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2408 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2408 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81603] VGAM2408 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2408 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2408 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2408 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2408 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81604] The complementary binding of VGAM2408 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2408 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2408 host target RNA into VGAM2408 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81605] It is appreciated that VGAM2408 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2408 host target genes. The mRNA of each one of this plurality of VGAM2408 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2408 RNA, herein designated VGAM RNA, and which when bound by VGAM2408 RNA causes inhibition of translation of respective one or more VGAM2408 host target proteins.

[81606] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2408 gene, herein designated VGAM GENE, on one or more VGAM2408 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81607] It is yet further appreciated that a function of VGAM2408 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2408 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2408 correlate with, and may be deduced from, the identity of the host target genes which VGAM2408 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81608] Nucleotide sequences of the VGAM2408 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2408 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2408 are further described hereinbelow with reference to Table 1.

[81609] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2408 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2408 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81610] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2408 gene, herein designated VGAM is inhibition of expression of VGAM2408 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2408 correlate with, and may be deduced from, the identity of the target genes which VGAM2408 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81611] Myeloma Overexpressed Gene (in a subset of t(11;14) Positive Multiple Myelomas) (MYEOV, Accession NM_138768) is a VGAM2408 host target gene. MYEOV BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MYEOV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYEOV BINDING SITE, designated SEQ ID:28998, to the nucleotide sequence of VGAM2408 RNA, herein designated VGAM RNA, also designated SEQ ID:5119.

[81612] A function of VGAM2408 is therefore inhibition of Myeloma Overexpressed Gene (in a subset of t(11;14) Positive Multiple Myelomas) (MYEOV, Accession NM_138768), a gene which is encoded by MYELOMA OVEREXPRESSED GENE. Accordingly, utilities of VGAM2408

include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYEOV. The function of MYEOV and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM471.JDD1 (Accession XM_032515) is another VGAM2408 host target gene. JDD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by JDD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JDD1 BINDING SITE, designated SEQ ID:31667, to the nucleotide sequence of VGAM2408 RNA, herein designated VGAM RNA, also designated SEQ ID:5119.

[81613] Another function of VGAM2408 is therefore inhibition of JDD1 (Accession XM_032515). Accordingly, utilities of VGAM2408 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JDD1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2409 (VGAM2409) viral gene, which modulates expression

of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81614] VGAM2409 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2409 was detected is described hereinabove with reference to Figs. 1-8.

[81615] VGAM2409 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2409 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81616] VGAM2409 gene encodes a VGAM2409 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2409 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2409 precursor RNA is designated SEQ ID:2395, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2395 is located at position 109177 relative to the genome of Goatpox Virus.

[81617] VGAM2409 precursor RNA folds onto itself, forming VGAM2409 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81618] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2409 folded precursor RNA into VGAM2409 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2409 RNA is designated SEQ ID:5120, and is provided hereinbelow with reference to the sequence listing part.

[81619] VGAM2409 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2409 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2409 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81620] VGAM2409 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2409 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2409 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2409 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2409 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81621] The complementary binding of VGAM2409 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2409 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2409 host target RNA into VGAM2409 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81622] It is appreciated that VGAM2409 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2409 host target genes. The mRNA of each one of this plurality of VGAM2409 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2409 RNA, herein designated VGAM RNA, and which when bound by VGAM2409 RNA causes inhibition of translation of respective one or more VGAM2409 host target proteins.

[81623] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2409 gene, herein designated VGAM GENE, on one or more VGAM2409 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81624] It is yet further appreciated that a function of VGAM2409 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2409 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2409 correlate with, and may be deduced from, the identity of the host target genes which VGAM2409 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[81625] Nucleotide sequences of the VGAM2409 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2409 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2409 are further described hereinbelow with reference to Table 1.

[81626] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2409 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2409 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81627] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2409 gene, herein designated VGAM is inhibition of expression of VGAM2409 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2409 correlate with, and may be deduced from, the identity of the target genes which VGAM2409 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81628] Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285) is a VGAM2409 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:27105 and SEQ ID:36116 respectively, to the nucleotide sequence of VGAM2409 RNA, herein designated VGAM RNA, also designated SEQ ID:5120.

[81629] A function of VGAM2409 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285). Accordingly, utilities of VGAM2409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2410 (VGAM2410) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81630] VGAM2410 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2410 was detected is described hereinabove with reference to Figs. 1-8.

[81631] VGAM2410 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2410 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81632] VGAM2410 gene encodes a VGAM2410 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2410 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2410 precursor RNA is designated SEQ ID:2396, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2396 is located at position 118894 relative to the genome of Goatpox Virus.

[81633] VGAM2410 precursor RNA folds onto itself, forming VGAM2410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81634] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2410 folded precursor RNA into VGAM2410 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2410 RNA is designated SEQ ID:5121, and is provided hereinbelow with reference to the sequence listing part.

[81635] VGAM2410 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2410 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2410 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[81636] VGAM2410 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2410 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2410 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2410 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2410 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81637] The complementary binding of VGAM2410 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2410 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2410 host target RNA into VGAM2410 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81638] It is appreciated that VGAM2410 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2410 host target genes. The mRNA of each one of this plurality of VGAM2410 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2410 RNA, herein designated VGAM RNA, and which when bound by VGAM2410 RNA causes inhibition of translation of respective one or more VGAM2410 host target proteins.

[81639] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2410 gene, herein designated VGAM GENE, on one or more VGAM2410 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81640] It is yet further appreciated that a function of VGAM2410 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2410 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2410 correlate with, and may be deduced from, the identity of the host target genes which VGAM2410 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81641] Nucleotide sequences of the VGAM2410 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2410 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2410 are further described hereinbelow with reference to Table 1.

[81642] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2410 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2410 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81643] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2410 gene, herein designated VGAM is inhibition of expression of VGAM2410 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2410 correlate with, and may be deduced from, the identity of the target genes which VGAM2410 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81644] SPF30 (Accession NM_005871) is a VGAM2410 host target gene. SPF30 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by SPF30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPF30 BINDING SITE, designated SEQ ID:12490, to the nucleotide sequence of VGAM2410 RNA, herein designated VGAM RNA, also designated SEQ ID:5121.

[81645] A function of VGAM2410 is therefore inhibition of SPF30 (Accession NM_005871). Accordingly, utilities of VGAM2410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPF30. LOC153339 (Accession XM_098362) is another VGAM2410 host target gene. LOC153339 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153339 BINDING SITE, designated SEQ ID:41614, to the nucleotide sequence of VGAM2410 RNA, herein designated VGAM RNA, also designated SEQ ID:5121.

[81646] Another function of VGAM2410 is therefore inhibition of

LOC153339 (Accession XM_098362). Accordingly, utilities of VGAM2410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153339. LOC154739 (Accession XM_098602) is another VGAM2410 host target gene. LOC154739 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41711, to the nucleotide sequence of VGAM2410 RNA, herein designated VGAM RNA, also designated SEQ ID:5121.

[81647] Another function of VGAM2410 is therefore inhibition of LOC154739 (Accession XM_098602). Accordingly, utilities of VGAM2410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. LOC92573 (Accession XM_045884) is another VGAM2410 host target gene. LOC92573 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:34596, to the nucleotide sequence of VGAM2410 RNA, herein designated VGAM RNA, also designated SEQ ID:5121.

[81648] Another function of VGAM2410 is therefore inhibition of LOC92573 (Accession XM_045884). Accordingly, utilities of VGAM2410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92573. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2411 (VGAM2411) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81649] VGAM2411 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2411 was detected is described hereinabove with reference to Figs. 1-8.

[81650] VGAM2411 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2411 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[81651] VGAM2411 gene encodes a VGAM2411 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2411 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2411 precursor RNA is designated SEQ ID:2397, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2397 is located at position 74764 relative to the genome of Goatpox Virus.

[81652] VGAM2411 precursor RNA folds onto itself, forming VGAM2411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81653] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2411 folded precursor RNA into VGAM2411 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2411 RNA is designated SEQ ID:5122, and is provided hereinbelow with reference to the sequence listing part.

[81654] VGAM2411 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2411 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2411 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81655] VGAM2411 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2411 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2411 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2411 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2411 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81656] The complementary binding of VGAM2411 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2411 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2411 host target RNA into VGAM2411 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81657] It is appreciated that VGAM2411 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2411 host target genes. The mRNA of each one of this plurality of VGAM2411 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2411 RNA, herein designated VGAM RNA, and which when bound by VGAM2411 RNA causes inhibition of translation of respective one or more VGAM2411 host target proteins.

[81658] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2411 gene, herein designated VGAM GENE, on one or more VGAM2411 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81659] It is yet further appreciated that a function of VGAM2411 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2411 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2411 correlate with, and may be deduced from, the identity of the host target genes which VGAM2411 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81660] Nucleotide sequences of the VGAM2411 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2411 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2411 are further described hereinbelow with reference to Table 1.

[81661] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2411 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2411 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81662] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2411 gene, herein designated VGAM is inhibition of expression of VGAM2411 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2411 correlate with, and may be deduced from, the identity of the target genes which VGAM2411 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81663] Radixin (RDX, Accession NM_002906) is a VGAM2411 host target gene. RDX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RDX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDX BINDING SITE, designated SEQ ID:8806, to the nucleotide sequence of VGAM2411 RNA, herein designated VGAM RNA, also designated SEQ ID:5122.

[81664] A function of VGAM2411 is therefore inhibition of Radixin

(RDX, Accession NM_002906), a gene which plays a crucial role in the binding of the barbed end of actin filaments to the plasma membrane. Accordingly, utilities of VGAM2411 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDX. The function of RDX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM290.XT3 (Accession NM_020208) is another VGAM2411 host target gene. XT3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XT3 BINDING SITE, designated SEQ ID:21440, to the nucleotide sequence of VGAM2411 RNA, herein designated VGAM RNA, also designated SEQ ID:5122.

[81665] Another function of VGAM2411 is therefore inhibition of XT3 (Accession NM_020208), a gene which is a Kidney-specific orphan transporter. Accordingly, utilities of VGAM2411 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XT3. The function of XT3 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM21.FLJ10607 (Accession XM_085119) is another VGAM2411 host target gene. FLJ10607 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10607 BINDING SITE, designated SEQ ID:37832, to the nucleotide sequence of VGAM2411 RNA, herein designated VGAM RNA, also designated SEQ ID:5122.

[81666] Another function of VGAM2411 is therefore inhibition of FLJ10607 (Accession XM_085119). Accordingly, utilities of VGAM2411 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10607. KIAA1622 (Accession NM_058237) is another VGAM2411 host target gene. KIAA1622 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1622 BINDING SITE, designated SEQ ID:27762, to the nucleotide sequence of VGAM2411 RNA, herein designated VGAM RNA, also designated SEQ ID:5122.

[81667] Another function of VGAM2411 is therefore inhibition of KIAA1622 (Accession NM_058237). Accordingly, utilities of VGAM2411 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1622. LOC196812 (Accession XM_116868) is another VGAM2411 host target gene. LOC196812 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196812 BINDING SITE, designated SEQ ID:43131, to the nucleotide sequence of VGAM2411 RNA, herein designated VGAM RNA, also designated SEQ ID:5122.

[81668] Another function of VGAM2411 is therefore inhibition of LOC196812 (Accession XM_116868). Accordingly, utilities of VGAM2411 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196812. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2412 (VGAM2412) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81669] VGAM2412 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2412 was detected is described hereinabove with reference to Figs. 1-8.

[81670] VGAM2412 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2412 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81671] VGAM2412 gene encodes a VGAM2412 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2412 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2412 precursor RNA is designated SEQ ID:2398, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2398 is located at position 52802 relative to the

genome of Goatpox Virus.

[81672] VGAM2412 precursor RNA folds onto itself, forming VGAM2412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81673] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2412 folded precursor RNA into VGAM2412 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM2412 RNA is designated SEQ ID:5123, and is provided hereinbelow with reference to the sequence listing part.

[81674] VGAM2412 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2412 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2412 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81675] VGAM2412 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2412 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2412 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2412 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2412 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81676] The complementary binding of VGAM2412 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2412 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2412 host target RNA into VGAM2412 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81677] It is appreciated that VGAM2412 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2412 host target genes. The mRNA of each one of this plurality of VGAM2412 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2412 RNA, herein designated VGAM RNA, and which when bound by VGAM2412 RNA causes inhibition of translation of respective one or more VGAM2412 host target proteins.

[81678] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2412 gene, herein designated VGAM GENE, on one or more VGAM2412 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81679] It is yet further appreciated that a function of VGAM2412 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2412 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2412 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81680] Nucleotide sequences of the VGAM2412 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2412 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2412 are further described hereinbelow with reference to Table 1.

[81681] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2412 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2412 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81682] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2412 gene, herein designated VGAM is inhibition of expression of VGAM2412 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2412 correlate with, and may be deduced

from, the identity of the target genes which VGAM2412 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81683] ATPase, Class VI, Type 11B (ATP11B, Accession XM_087254) is a VGAM2412 host target gene. ATP11B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11B BINDING SITE, designated SEQ ID:39145, to the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, also designated SEQ ID:5123.

[81684] A function of VGAM2412 is therefore inhibition of ATPase, Class VI, Type 11B (ATP11B, Accession XM_087254), a gene which is phosphorylated in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11B. The function of ATP11B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665.Monoamine Oxidase

B (MAOB, Accession XM_010261) is another VGAM2412 host target gene. MAOB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAOB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAOB BINDING SITE, designated SEQ ID:30148, to the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, also designated SEQ ID:5123.

[81685] Another function of VGAM2412 is therefore inhibition of Monoamine Oxidase B (MAOB, Accession XM_010261). Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAOB. Usher Syndrome 2A (autosomal recessive, mild) (USH2A, Accession NM_007123) is another VGAM2412 host target gene. USH2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USH2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USH2A BINDING SITE, designated SEQ

ID:13981, to the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, also designated SEQ ID:5123.

[81686] Another function of VGAM2412 is therefore inhibition of Usher Syndrome 2A (autosomal recessive, mild) (USH2A, Accession NM_007123). Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USH2A. Chromosome 3 Open Reading Frame 4 (C3orf4, Accession NM_019895) is another VGAM2412 host target gene. C3orf4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C3orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C3orf4 BINDING SITE, designated SEQ ID:21280, to the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, also designated SEQ ID:5123.

[81687] Another function of VGAM2412 is therefore inhibition of Chromosome 3 Open Reading Frame 4 (C3orf4, Accession NM_019895). Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with C3orf4. Glia Maturation Factor, Beta (GMFB, Accession NM_004124) is another VGAM2412 host target gene. GMFB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GMFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMFB BINDING SITE, designated SEQ ID:10328, to the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, also designated SEQ ID:5123.

[81688] Another function of VGAM2412 is therefore inhibition of Glia Maturation Factor, Beta (GMFB, Accession NM_004124). Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMFB. KIAA0410 (Accession NM_014778) is another VGAM2412 host target gene. KIAA0410 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0410, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0410 BINDING SITE, designated SEQ

ID:16616, to the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, also designated SEQ ID:5123.

[81689] Another function of VGAM2412 is therefore inhibition of KIAA0410 (Accession NM_014778). Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0410. KIAA1493 (Accession XM_034415) is another VGAM2412 host target gene. KIAA1493 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:32093, to the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, also designated SEQ ID:5123.

[81690] Another function of VGAM2412 is therefore inhibition of KIAA1493 (Accession XM_034415). Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493. Nuclear Transcription Factor, X-box Binding 1 (NFX1, Accession NM_002504) is another VGAM2412 host

target gene. NFX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NFX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFX1 BINDING SITE, designated SEQ ID:8327, to the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, also designated SEQ ID:5123.

[81691] Another function of VGAM2412 is therefore inhibition of Nuclear Transcription Factor, X-box Binding 1 (NFX1, Accession NM_002504). Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFX1. LOC143425 (Accession XM_113695) is another VGAM2412 host target gene. LOC143425 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143425 BINDING SITE, designated SEQ ID:42356, to the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5123.

[81692] Another function of VGAM2412 is therefore inhibition of LOC143425 (Accession XM_113695). Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143425. LOC221540 (Accession XM_168133) is another VGAM2412 host target gene. LOC221540 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221540 BINDING SITE, designated SEQ ID:45046, to the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, also designated SEQ ID:5123.

[81693] Another function of VGAM2412 is therefore inhibition of LOC221540 (Accession XM_168133). Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221540. LOC257545 (Accession XM_175217) is another VGAM2412 host target gene. LOC257545 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257545, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257545 BINDING SITE, designated SEQ ID:46694, to the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, also designated SEQ ID:5123.

[81694] Another function of VGAM2412 is therefore inhibition of LOC257545 (Accession XM_175217). Accordingly, utilities of VGAM2412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257545. LOC257598 (Accession XM_175295) is another VGAM2412 host target gene. LOC257598 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257598 BINDING SITE, designated SEQ ID:46751, to the nucleotide sequence of VGAM2412 RNA, herein designated VGAM RNA, also designated SEQ ID:5123.

[81695] Another function of VGAM2412 is therefore inhibition of LOC257598 (Accession XM_175295). Accordingly, utilities of VGAM2412 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC257598. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2413 (VGAM2413) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81696] VGAM2413 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2413 was detected is described hereinabove with reference to Figs. 1-8.

[81697] VGAM2413 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2413 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81698] VGAM2413 gene encodes a VGAM2413 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2413 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2413 precursor RNA is desig-

nated SEQ ID:2399, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2399 is located at position 77043 relative to the genome of Goatpox Virus.

[81699] VGAM2413 precursor RNA folds onto itself, forming VGAM2413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81700] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2413 folded precursor RNA into VGAM2413 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2413 RNA is designated SEQ ID:5124, and is provided hereinbelow with reference to the sequence

listing part.

[81701] VGAM2413 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2413 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2413 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81702] VGAM2413 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2413 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2413 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2413 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2413 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81703] The complementary binding of VGAM2413 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2413 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2413 host target RNA into VGAM2413 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81704] It is appreciated that VGAM2413 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2413 host target genes. The mRNA of each one of this plurality of VGAM2413 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2413 RNA, herein designated VGAM

RNA, and which when bound by VGAM2413 RNA causes inhibition of translation of respective one or more VGAM2413 host target proteins.

[81705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2413 gene, herein designated VGAM GENE, on one or more VGAM2413 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81706] It is yet further appreciated that a function of VGAM2413 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2413 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2413 correlate with, and may be deduced from, the identity of the host target genes which VGAM2413 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81707] Nucleotide sequences of the VGAM2413 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2413 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2413 are further described hereinbelow with reference to Table 1.

[81708] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2413 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2413 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81709] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2413 gene, herein designated VGAM is

inhibition of expression of VGAM2413 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2413 correlate with, and may be deduced from, the identity of the target genes which VGAM2413 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81710] KIAA1155 (Accession XM_030864) is a VGAM2413 host target gene. KIAA1155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:31197, to the nucleotide sequence of VGAM2413 RNA, herein designated VGAM RNA, also designated SEQ ID:5124.

[81711] A function of VGAM2413 is therefore inhibition of KIAA1155 (Accession XM_030864). Accordingly, utilities of VGAM2413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1155. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2414 (VGAM2414) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81712] VGAM2414 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2414 was detected is described hereinabove with reference to Figs. 1-8.

[81713] VGAM2414 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2414 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81714] VGAM2414 gene encodes a VGAM2414 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2414 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2414 precursor RNA is designated SEQ ID:2400, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2400 is located at position 57820 relative to the genome of Goatpox Virus.

[81715] VGAM2414 precursor RNA folds onto itself, forming VGAM2414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81716] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2414 folded precursor RNA into VGAM2414 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2414 RNA is designated SEQ ID:5125, and is provided hereinbelow with reference to the sequence listing part.

[81717] VGAM2414 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2414 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2414 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81718] VGAM2414 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2414 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2414 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2414 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2414 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81719] The complementary binding of VGAM2414 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2414 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2414 host target RNA into VGAM2414 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81720] It is appreciated that VGAM2414 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2414 host target genes. The mRNA of each one of this plurality of VGAM2414 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2414 RNA, herein designated VGAM RNA, and which when bound by VGAM2414 RNA causes inhibition of translation of respective one or more VGAM2414 host target proteins.

[81721] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2414 gene, herein designated VGAM GENE, on one or more VGAM2414 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81722] It is yet further appreciated that a function of VGAM2414 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2414 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2414 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2414 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81723] Nucleotide sequences of the VGAM2414 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2414 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2414 are further described hereinbelow with reference to Table 1.

[81724] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2414 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2414 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81725] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2414 gene, herein designated VGAM is inhibition of expression of VGAM2414 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2414 correlate with, and may be deduced from, the identity of the target genes which VGAM2414

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81726] Mannosidase, Alpha, Class 2C, Member 1 (MAN2C1, Accession XM_053585) is a VGAM2414 host target gene. MAN2C1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAN2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN2C1 BINDING SITE, designated SEQ ID:36101, to the nucleotide sequence of VGAM2414 RNA, herein designated VGAM RNA, also designated SEQ ID:5125.

[81727] A function of VGAM2414 is therefore inhibition of Mannosidase, Alpha, Class 2C, Member 1 (MAN2C1, Accession XM_053585), a gene which is Strongly similar to a region of rat ER alpha-mannosidase. Accordingly, utilities of VGAM2414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN2C1. The function of MAN2C1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM958.Proprotein Convertase Subtil-

isin/kexin Type 2 (PCSK2, Accession NM_002594) is another VGAM2414 host target gene. PCSK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCSK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCSK2 BINDING SITE, designated SEQ ID:8455, to the nucleotide sequence of VGAM2414 RNA, herein designated VGAM RNA, also designated SEQ ID:5125.

[81728] Another function of VGAM2414 is therefore inhibition of Proprotein Convertase Subtilisin/kexin Type 2 (PCSK2, Accession NM_002594), a gene which is involved in the processing of hormone and other protein precursors at sites comprised of pairs of basic amino acid residues. Accordingly, utilities of VGAM2414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCSK2. The function of PCSK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1120.Phosphorylase Kinase, Alpha 2 (liver) (PHKA2, Accession NM_000292) is another VGAM2414 host target gene. PHKA2 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PHKA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHKA2 BINDING SITE, designated SEQ ID:5835, to the nucleotide sequence of VGAM2414 RNA, herein designated VGAM RNA, also designated SEQ ID:5125.

[81729] Another function of VGAM2414 is therefore inhibition of Phosphorylase Kinase, Alpha 2 (liver) (PHKA2, Accession NM_000292). Accordingly, utilities of VGAM2414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHKA2. KIAA1458 (Accession XM_044434) is another VGAM2414 host target gene. KIAA1458 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1458, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1458 BINDING SITE, designated SEQ ID:34208, to the nucleotide sequence of VGAM2414 RNA, herein designated VGAM RNA, also designated SEQ ID:5125.

[81730] Another function of VGAM2414 is therefore inhibition of KIAA1458 (Accession XM_044434). Accordingly, utilities of VGAM2414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1458. Rabip4R (Accession NM_017987) is another VGAM2414 host target gene. Rabip4R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Rabip4R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rabip4R BINDING SITE, designated SEQ ID:19715, to the nucleotide sequence of VGAM2414 RNA, herein designated VGAM RNA, also designated SEQ ID:5125.

[81731] Another function of VGAM2414 is therefore inhibition of Rabip4R (Accession NM_017987). Accordingly, utilities of VGAM2414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rabip4R. Sulfotransferase Family 4A, Member 1 (SULT4A1, Accession XM_043609) is another VGAM2414 host target gene. SULT4A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SULT4A1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT4A1 BINDING SITE, designated SEQ ID:33974, to the nucleotide sequence of VGAM2414 RNA, herein designated VGAM RNA, also designated SEQ ID:5125.

[81732] Another function of VGAM2414 is therefore inhibition of Sulfotransferase Family 4A, Member 1 (SULT4A1, Accession XM_043609). Accordingly, utilities of VGAM2414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT4A1. LOC146958 (Accession XM_097142) is another VGAM2414 host target gene. LOC146958 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146958 BINDING SITE, designated SEQ ID:40773, to the nucleotide sequence of VGAM2414 RNA, herein designated VGAM RNA, also designated SEQ ID:5125.

[81733] Another function of VGAM2414 is therefore inhibition of LOC146958 (Accession XM_097142). Accordingly, utilities

of VGAM2414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146958. LOC257443 (Accession XM_171072) is another VGAM2414 host target gene. LOC257443 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257443 BINDING SITE, designated SEQ ID:45876, to the nucleotide sequence of VGAM2414 RNA, herein designated VGAM RNA, also designated SEQ ID:5125.

[81734] Another function of VGAM2414 is therefore inhibition of LOC257443 (Accession XM_171072). Accordingly, utilities of VGAM2414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257443. LOC90643 (Accession XM_033145) is another VGAM2414 host target gene. LOC90643 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90643 BINDING SITE, designated SEQ ID:31854, to the nucleotide sequence of VGAM2414 RNA, herein designated VGAM RNA, also designated SEQ ID:5125.

[81735] Another function of VGAM2414 is therefore inhibition of LOC90643 (Accession XM_033145). Accordingly, utilities of VGAM2414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90643. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2415 (VGAM2415) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81736] VGAM2415 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2415 was detected is described hereinabove with reference to Figs. 1-8.

[81737] VGAM2415 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2415 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81738] VGAM2415 gene encodes a VGAM2415 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2415 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2415 precursor RNA is designated SEQ ID:2401, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2401 is located at position 96068 relative to the genome of Goatpox Virus.

[81739] VGAM2415 precursor RNA folds onto itself, forming VGAM2415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81740] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2415 folded precursor RNA into VGAM2415 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2415 RNA is designated SEQ ID:5126, and is provided hereinbelow with reference to the sequence listing part.

[81741] VGAM2415 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2415 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2415 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81742] VGAM2415 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2415 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2415 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2415 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2415 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81743] The complementary binding of VGAM2415 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2415 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2415 host target RNA into VGAM2415 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81744] It is appreciated that VGAM2415 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2415 host target genes. The mRNA of each one of this plurality of VGAM2415 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2415 RNA, herein designated VGAM RNA, and which when bound by VGAM2415 RNA causes inhibition of translation of respective one or more VGAM2415 host target proteins.

[81745] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2415 gene, herein designated VGAM GENE, on one or more VGAM2415 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81746] It is yet further appreciated that a function of VGAM2415 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2415 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2415 correlate with, and may be deduced from, the identity of the host target genes which VGAM2415 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81747] Nucleotide sequences of the VGAM2415 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2415 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2415 are further described hereinbelow with reference to Table 1.

[81748] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2415 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2415 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81749] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2415 gene, herein designated VGAM is inhibition of expression of VGAM2415 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2415 correlate with, and may be deduced from, the identity of the target genes which VGAM2415 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81750] LanC Lantibiotic Synthetase Component C-like 2 (bacterial) (LANCL2, Accession NM_018697) is a VGAM2415 host target gene. LANCL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LANCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANCL2 BINDING SITE, designated SEQ ID:20779, to the nucleotide sequence of VGAM2415 RNA, herein designated VGAM RNA, also designated SEQ ID:5126.

[81751] A function of VGAM2415 is therefore inhibition of LanC Lantibiotic Synthetase Component C-like 2 (bacterial) (LANCL2, Accession NM_018697). Accordingly, utilities of VGAM2415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL2. Makorin, Ring Finger Protein, 1 (MKRN1, Accession NM_013446) is another VGAM2415 host target gene. MKRN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MKRN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKRN1 BINDING SITE, designated SEQ ID:15114, to the nucleotide sequence of VGAM2415 RNA, herein designated VGAM RNA, also designated SEQ ID:5126.

[81752] Another function of VGAM2415 is therefore inhibition of Makorin, Ring Finger Protein, 1 (MKRN1, Accession NM_013446). Accordingly, utilities of VGAM2415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN1. RTP801 (Accession NM_019058) is another VGAM2415 host target gene. RTP801 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by RTP801, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RTP801 BINDING SITE, designated SEQ ID:21140, to the nucleotide sequence of VGAM2415 RNA, herein designated VGAM RNA, also designated SEQ ID:5126.

[81753] Another function of VGAM2415 is therefore inhibition of RTP801 (Accession NM_019058). Accordingly, utilities of VGAM2415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RTP801. LOC158450 (Accession XM_088580) is another VGAM2415 host target gene. LOC158450 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158450 BINDING SITE, designated SEQ ID:39843, to the nucleotide sequence of VGAM2415 RNA, herein designated VGAM RNA, also designated SEQ ID:5126.

[81754] Another function of VGAM2415 is therefore inhibition of

LOC158450 (Accession XM_088580). Accordingly, utilities of VGAM2415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158450. LOC158504 (Accession XM_088591) is another VGAM2415 host target gene. LOC158504 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158504 BINDING SITE, designated SEQ ID:39854, to the nucleotide sequence of VGAM2415 RNA, herein designated VGAM RNA, also designated SEQ ID:5126.

[81755] Another function of VGAM2415 is therefore inhibition of LOC158504 (Accession XM_088591). Accordingly, utilities of VGAM2415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158504. LOC253613 (Accession XM_171225) is another VGAM2415 host target gene. LOC253613 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC253613 BINDING SITE, designated SEQ ID:46011, to the nucleotide sequence of VGAM2415 RNA, herein designated VGAM RNA, also designated SEQ ID:5126.

[81756] Another function of VGAM2415 is therefore inhibition of LOC253613 (Accession XM_171225). Accordingly, utilities of VGAM2415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253613. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2416 (VGAM2416) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81757] VGAM2416 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2416 was detected is described hereinabove with reference to Figs. 1-8.

[81758] VGAM2416 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2416 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[81759] VGAM2416 gene encodes a VGAM2416 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2416 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2416 precursor RNA is designated SEQ ID:2402, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2402 is located at position 126030 relative to the genome of Goatpox Virus.

[81760] VGAM2416 precursor RNA folds onto itself, forming VGAM2416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81761] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2416 folded precursor RNA into VGAM2416 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2416 RNA is designated SEQ ID:5127, and is provided hereinbelow with reference to the sequence listing part.

[81762] VGAM2416 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2416 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2416 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81763] VGAM2416 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2416 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2416 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2416 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2416 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81764] The complementary binding of VGAM2416 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2416 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2416 host target RNA into VGAM2416 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81765] It is appreciated that VGAM2416 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2416 host target genes. The mRNA of each one of this plurality of VGAM2416 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2416 RNA, herein designated VGAM RNA, and which when bound by VGAM2416 RNA causes inhibition of translation of respective one or more VGAM2416 host target proteins.

[81766] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2416 gene, herein designated VGAM GENE, on one or more VGAM2416 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81767] It is yet further appreciated that a function of VGAM2416 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2416 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2416 correlate with, and may be deduced from, the identity of the host target genes which VGAM2416 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81768] Nucleotide sequences of the VGAM2416 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2416 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2416 are further described hereinbelow with reference to Table 1.

[81769] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2416 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2416 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81770] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2416 gene, herein designated VGAM is inhibition of expression of VGAM2416 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2416 correlate with, and may be deduced from, the identity of the target genes which VGAM2416 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81771] Core-binding Factor, Beta Subunit (CBFB, Accession NM_001755) is a VGAM2416 host target gene. CBFB BINDING SITE1 and CBFB BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CBFB, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFB BINDING SITE1 and CBFB BINDING SITE2, designated SEQ ID:7509 and SEQ ID:23150 respectively, to the nucleotide sequence of VGAM2416

RNA, herein designated VGAM RNA, also designated SEQ ID:5127.

[81772] A function of VGAM2416 is therefore inhibition of Core-binding Factor, Beta Subunit (CBFB, Accession NM_001755), a gene which is beta subunit of the transcription factor CBF which causes leukemia. Accordingly, utilities of VGAM2416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFB. The function of CBFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM98.Secreted Frizzled-related Protein 1 (SFRP1, Accession NM_003012) is another VGAM2416 host target gene. SFRP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP1 BINDING SITE, designated SEQ ID:8925, to the nucleotide sequence of VGAM2416 RNA, herein designated VGAM RNA, also designated SEQ ID:5127.

[81773] Another function of VGAM2416 is therefore inhibition of

Secreted Frizzled-related Protein 1 (SFRP1, Accession NM_003012), a gene which is a receptor for wnt proteins that may have an anti-apoptotic function. Accordingly, utilities of VGAM2416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP1. The function of SFRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250.Synaptotagmin IV (SYT4, Accession XM_031162) is another VGAM2416 host target gene. SYT4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT4 BINDING SITE, designated SEQ ID:31294, to the nucleotide sequence of VGAM2416 RNA, herein designated VGAM RNA, also designated SEQ ID:5127.

[81774] Another function of VGAM2416 is therefore inhibition of Synaptotagmin IV (SYT4, Accession XM_031162), a gene which may be involved in ca2+-dependent exocytosis of secretory vesicles or may serve as ca2+ sensors in the process of vesicular trafficking and exocytosis. Accord-

ingly, utilities of VGAM2416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT4. The function of SYT4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Transient Receptor Potential Cation Channel, Subfamily C, Member 5 (TRPC5, Accession NM_012471) is another VGAM2416 host target gene. TRPC5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRPC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC5 BINDING SITE, designated SEQ ID:14852, to the nucleotide sequence of VGAM2416 RNA, herein designated VGAM RNA, also designated SEQ ID:5127.

[81775] Another function of VGAM2416 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 5 (TRPC5, Accession NM_012471). Accordingly, utilities of VGAM2416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC5. MIG2 (Accession XM_051693) is another

VGAM2416 host target gene. MIG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MIG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG2 BINDING SITE, designated SEQ ID:35864, to the nucleotide sequence of VGAM2416 RNA, herein designated VGAM RNA, also designated SEQ ID:5127.

[81776] Another function of VGAM2416 is therefore inhibition of MIG2 (Accession XM_051693). Accordingly, utilities of VGAM2416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG2. Nudix (nucleoside diphosphate linked moiety X)-type Motif 4 (NUDT4, Accession NM_019094) is another VGAM2416 host target gene. NUDT4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUDT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT4 BINDING SITE, designated SEQ ID:21170, to the nucleotide sequence of VGAM2416 RNA, herein designated VGAM RNA,

also designated SEQ ID:5127.

[81777] Another function of VGAM2416 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 4 (NUDT4, Accession NM_019094). Accordingly, utilities of VGAM2416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT4. PRO2012 (Accession NM_018614) is another VGAM2416 host target gene. PRO2012 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2012 BINDING SITE, designated SEQ ID:20682, to the nucleotide sequence of VGAM2416 RNA, herein designated VGAM RNA, also designated SEQ ID:5127.

[81778] Another function of VGAM2416 is therefore inhibition of PRO2012 (Accession NM_018614). Accordingly, utilities of VGAM2416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2012. Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202) is another VGAM2416 host target gene. SS18L1 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SS18L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS18L1 BINDING SITE, designated SEQ ID:32566, to the nucleotide sequence of VGAM2416 RNA, herein designated VGAM RNA, also designated SEQ ID:5127.

[81779] Another function of VGAM2416 is therefore inhibition of Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202). Accordingly, utilities of VGAM2416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS18L1. Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 2 (STAM2, Accession NM_005843) is another VGAM2416 host target gene. STAM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAM2 BINDING SITE, designated SEQ ID:12461, to the nucleotide sequence of VGAM2416 RNA,

herein designated VGAM RNA, also designated SEQ ID:5127.

[81780] Another function of VGAM2416 is therefore inhibition of Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 2 (STAM2, Accession NM_005843). Accordingly, utilities of VGAM2416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAM2. LOC139221 (Accession XM_066558) is another VGAM2416 host target gene. LOC139221 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC139221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139221 BINDING SITE, designated SEQ ID:37334, to the nucleotide sequence of VGAM2416 RNA, herein designated VGAM RNA, also designated SEQ ID:5127.

[81781] Another function of VGAM2416 is therefore inhibition of LOC139221 (Accession XM_066558). Accordingly, utilities of VGAM2416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139221. LOC161734 (Accession XM_102109) is another VGAM2416 host target gene. LOC161734 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC161734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161734 BINDING SITE, designated SEQ ID:42111, to the nucleotide sequence of VGAM2416 RNA, herein designated VGAM RNA, also designated SEQ ID:5127.

[81782] Another function of VGAM2416 is therefore inhibition of LOC161734 (Accession XM_102109). Accordingly, utilities of VGAM2416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161734. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2417 (VGAM2417) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81783] VGAM2417 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2417 was detected is described hereinabove with reference to Figs. 1-8.

[81784] VGAM2417 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2417 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81785] VGAM2417 gene encodes a VGAM2417 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2417 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2417 precursor RNA is designated SEQ ID:2403, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2403 is located at position 96899 relative to the genome of Goatpox Virus.

[81786] VGAM2417 precursor RNA folds onto itself, forming VGAM2417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[81787] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2417 folded precursor RNA into VGAM2417 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2417 RNA is designated SEQ ID:5128, and is provided hereinbelow with reference to the sequence listing part.

[81788] VGAM2417 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2417 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2417 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81789] VGAM2417 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2417 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2417 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2417 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2417 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81790] The complementary binding of VGAM2417 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2417 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2417 host target RNA into VGAM2417 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81791] It is appreciated that VGAM2417 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2417 host target genes. The mRNA of each one of this plurality of VGAM2417 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2417 RNA, herein designated VGAM RNA, and which when bound by VGAM2417 RNA causes inhibition of translation of respective one or more VGAM2417 host target proteins.

[81792] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2417 gene, herein designated VGAM GENE, on one or more VGAM2417 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81793] It is yet further appreciated that a function of VGAM2417 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2417 correlate with, and may be deduced from, the identity of the host target genes which VGAM2417 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81794] Nucleotide sequences of the VGAM2417 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2417 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2417 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2417 are further described hereinbelow with reference to Table 1.

[81795] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2417 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2417 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81796] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2417 gene, herein designated VGAM is inhibition of expression of VGAM2417 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2417 correlate with, and may be deduced from, the identity of the target genes which VGAM2417 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81797] Cyclin D1 (PRAD1: parathyroid adenomatosis 1) (CCND1, Accession NM_053056) is a VGAM2417 host target gene. CCND1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CCND1 BINDING SITE, designated SEQ ID:27601, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81798] A function of VGAM2417 is therefore inhibition of Cyclin D1 (PRAD1: parathyroid adenomatosis 1) (CCND1, Accession NM_053056), a gene which is involved in the control of cell cycle and is required for Schwann cell proliferation to proceed normally during Wallerian degeneration. Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND1. The function of CCND1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM220.CD164 Antigen, Sialomucin (CD164, Accession NM_006016) is another VGAM2417 host target gene. CD164 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD164 BIND-

ING SITE, designated SEQ ID:12629, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81799] Another function of VGAM2417 is therefore inhibition of CD164 Antigen, Sialomucin (CD164, Accession NM_006016), a gene which plays a role in hematopoiesis by facilitating the adhesion of CD34+ cells to bone marrow stroma and negatively regulates CD34+ hematopoietic progenitor cell growth. Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD164. The function of CD164 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM75.Crystallin, Zeta (quinone reductase) (CRYZ, Accession NM_001889) is another VGAM2417 host target gene. CRYZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRYZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRYZ BINDING SITE, designated SEQ ID:7618, to the nucleotide sequence of VGAM2417 RNA, herein

designated VGAM RNA, also designated SEQ ID:5128.

[81800] Another function of VGAM2417 is therefore inhibition of Crystallin, Zeta (quinone reductase) (CRYZ, Accession NM_001889), a gene which may act in the detoxification of xenobiotics. Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRYZ. The function of CRYZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.FLJ12960 (Accession NM_024638) is another VGAM2417 host target gene. FLJ12960 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12960 BINDING SITE, designated SEQ ID:23919, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81801] Another function of VGAM2417 is therefore inhibition of FLJ12960 (Accession NM_024638). Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12960. KIAA0478 (Accession NM_014870) is another VGAM2417 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16984, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81802] Another function of VGAM2417 is therefore inhibition of KIAA0478 (Accession NM_014870). Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. KIAA1116 (Accession NM_014892) is another VGAM2417 host target gene. KIAA1116 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1116 BINDING SITE, designated SEQ ID:17040, to the

nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81803] Another function of VGAM2417 is therefore inhibition of KIAA1116 (Accession NM_014892). Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1116. KIAA1559 (Accession XM_054472) is another VGAM2417 host target gene. KIAA1559 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1559 BINDING SITE, designated SEQ ID:36165, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81804] Another function of VGAM2417 is therefore inhibition of KIAA1559 (Accession XM_054472). Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1559. PB1 (Accession NM_018165) is another VGAM2417 host target gene. PB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by PB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PB1 BINDING SITE, designated SEQ ID:19981, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81805] Another function of VGAM2417 is therefore inhibition of PB1 (Accession NM_018165). Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PB1. PRO0641 (Accession NM_014135) is another VGAM2417 host target gene. PRO0641 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0641 BINDING SITE, designated SEQ ID:15402, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81806] Another function of VGAM2417 is therefore inhibition of PRO0641 (Accession NM_014135). Accordingly, utilities of

VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0641. SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469) is another VGAM2417 host target gene. SH3BGRL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3BGRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL2 BINDING SITE, designated SEQ ID:25523, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81807] Another function of VGAM2417 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469). Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL2. Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM_007107) is another VGAM2417 host target gene. SSR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSR3, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR3 BINDING SITE, designated SEQ ID:13972, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81808] Another function of VGAM2417 is therefore inhibition of Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM_007107). Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSR3. LOC144871 (Accession XM_096698) is another VGAM2417 host target gene. LOC144871 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144871 BINDING SITE, designated SEQ ID:40471, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81809] Another function of VGAM2417 is therefore inhibition of LOC144871 (Accession XM_096698). Accordingly, utilities

of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144871. LOC151473 (Accession XM_087215) is another VGAM2417 host target gene. LOC151473 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151473 BINDING SITE, designated SEQ ID:39121, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81810] Another function of VGAM2417 is therefore inhibition of LOC151473 (Accession XM_087215). Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151473. LOC158428 (Accession XM_047249) is another VGAM2417 host target gene. LOC158428 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC158428 BINDING SITE, designated SEQ ID:34922, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81811] Another function of VGAM2417 is therefore inhibition of LOC158428 (Accession XM_047249). Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158428. LOC197287 (Accession XM_027541) is another VGAM2417 host target gene. LOC197287 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197287 BINDING SITE, designated SEQ ID:30523, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81812] Another function of VGAM2417 is therefore inhibition of LOC197287 (Accession XM_027541). Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197287. LOC255265 (Accession XM_170902) is another VGAM2417 host target gene. LOC255265 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255265 BINDING SITE, designated SEQ ID:45658, to the nucleotide sequence of VGAM2417 RNA, herein designated VGAM RNA, also designated SEQ ID:5128.

[81813] Another function of VGAM2417 is therefore inhibition of LOC255265 (Accession XM_170902). Accordingly, utilities of VGAM2417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255265. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2418 (VGAM2418) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81814] VGAM2418 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2418 was detected is described hereinabove with reference to Figs. 1-8.

[81815] VGAM2418 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2418 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81816] VGAM2418 gene encodes a VGAM2418 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2418 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2418 precursor RNA is designated SEQ ID:2404, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2404 is located at position 117185 relative to the genome of Goatpox Virus.

[81817] VGAM2418 precursor RNA folds onto itself, forming VGAM2418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[81818] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2418 folded precursor RNA into VGAM2418 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2418 RNA is designated SEQ ID:5129, and is provided hereinbelow with reference to the sequence listing part.

[81819] VGAM2418 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2418 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2418 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81820] VGAM2418 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2418 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2418 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2418 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2418 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81821] The complementary binding of VGAM2418 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2418 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2418 host target RNA into VGAM2418 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81822] It is appreciated that VGAM2418 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2418 host target genes. The mRNA of each one of this plurality of VGAM2418 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2418 RNA, herein designated VGAM RNA, and which when bound by VGAM2418 RNA causes inhibition of translation of respective one or more VGAM2418 host target proteins.

[81823] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2418 gene, herein designated VGAM GENE, on one or more VGAM2418 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81824] It is yet further appreciated that a function of VGAM2418 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2418 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2418 correlate with, and may be deduced from, the identity of the host target genes which VGAM2418 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81825] Nucleotide sequences of the VGAM2418 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2418 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2418 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2418 are further described hereinbelow with reference to Table 1.

[81826] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2418 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2418 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81827] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2418 gene, herein designated VGAM is inhibition of expression of VGAM2418 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2418 correlate with, and may be deduced from, the identity of the target genes which VGAM2418 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81828] Netrin 4 (NTN4, Accession XM_031896) is a VGAM2418 host target gene. NTN4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of NTN4 BINDING SITE, designated SEQ ID:31508, to the nucleotide sequence of VGAM2418 RNA, herein designated VGAM RNA, also designated SEQ ID:5129.

[81829] A function of VGAM2418 is therefore inhibition of Netrin 4 (NTN4, Accession XM_031896). Accordingly, utilities of VGAM2418 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTN4. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2419 (VGAM2419) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81830] VGAM2419 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2419 was detected is described hereinabove with reference to Figs. 1-8.

[81831] VGAM2419 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2419 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81832] VGAM2419 gene encodes a VGAM2419 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2419 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2419 precursor RNA is designated SEQ ID:2405, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2405 is located at position 104440 relative to the genome of Goatpox Virus.

[81833] VGAM2419 precursor RNA folds onto itself, forming VGAM2419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81834] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2419 folded precursor RNA into VGAM2419 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2419 RNA is designated SEQ ID:5130, and is provided hereinbelow with reference to the sequence listing part.

[81835] VGAM2419 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2419 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2419 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81836] VGAM2419 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2419 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2419 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2419 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2419 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81837] The complementary binding of VGAM2419 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2419 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2419 host target RNA into VGAM2419 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81838] It is appreciated that VGAM2419 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2419 host target genes. The mRNA of each one of this plurality of VGAM2419 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2419 RNA, herein designated VGAM RNA, and which when bound by VGAM2419 RNA causes inhibition of translation of respective one or more VGAM2419 host target proteins.

[81839] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2419 gene, herein designated VGAM GENE, on one or more VGAM2419 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81840] It is yet further appreciated that a function of VGAM2419 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2419 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2419 correlate with, and may be deduced from, the identity of the host target genes which VGAM2419 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81841] Nucleotide sequences of the VGAM2419 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2419 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2419 are further described hereinbelow with reference to Table 1.

[81842] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2419 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2419 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81843] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2419 gene, herein designated VGAM is inhibition of expression of VGAM2419 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2419 correlate with, and may be deduced from, the identity of the target genes which VGAM2419 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81844] Calbindin 1, 28kDa (CALB1, Accession NM_004929) is a VGAM2419 host target gene. CALB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CALB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALB1 BINDING SITE, designated SEQ ID:11369, to the nucleotide sequence of VGAM2419 RNA, herein designated VGAM RNA, also designated SEQ ID:5130.

[81845] A function of VGAM2419 is therefore inhibition of Cal-

bindin 1, 28kDa (CALB1, Accession NM_004929), a gene which buffers cytosolic calcium. Accordingly, utilities of VGAM2419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALB1. The function of CALB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM266.F-box and Leucine-rich Repeat Protein 2 (FBXL2, Accession NM_012157) is another VGAM2419 host target gene. FBXL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL2 BINDING SITE, designated SEQ ID:14453, to the nucleotide sequence of VGAM2419 RNA, herein designated VGAM RNA, also designated SEQ ID:5130.

[81846] Another function of VGAM2419 is therefore inhibition of F-box and Leucine-rich Repeat Protein 2 (FBXL2, Accession NM_012157). Accordingly, utilities of VGAM2419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL2. SMT3 Suppres-

sor of Mif Two 3 Homolog 1 (yeast) (SMT3H1, Accession XM_009805) is another VGAM2419 host target gene. SMT3H1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMT3H1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMT3H1 BINDING SITE, designated SEQ ID:30123, to the nucleotide sequence of VGAM2419 RNA, herein designated VGAM RNA, also designated SEQ ID:5130.

[81847] Another function of VGAM2419 is therefore inhibition of SMT3 Suppressor of Mif Two 3 Homolog 1 (yeast) (SMT3H1, Accession XM_009805), a gene which is involved in the function and/or structure of the eukaryotic kinetochore. Accordingly, utilities of VGAM2419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMT3H1. The function of SMT3H1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM119.DKFZP434P0721 (Accession XM_033181) is another VGAM2419 host target gene. DKFZP434P0721

BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0721 BINDING SITE, designated SEQ ID:31873, to the nucleotide sequence of VGAM2419 RNA, herein designated VGAM RNA, also designated SEQ ID:5130.

[81848] Another function of VGAM2419 is therefore inhibition of DKFZP434P0721 (Accession XM_033181). Accordingly, utilities of VGAM2419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0721. KIAA1084 (Accession NM_014910) is another VGAM2419 host target gene. KIAA1084 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1084 BINDING SITE, designated SEQ ID:17134, to the nucleotide sequence of VGAM2419 RNA, herein designated VGAM RNA, also designated SEQ ID:5130.

[81849] Another function of VGAM2419 is therefore inhibition of KIAA1084 (Accession NM_014910). Accordingly, utilities of VGAM2419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1084. MGC10911 (Accession NM_032302) is another VGAM2419 host target gene. MGC10911 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC10911, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10911 BINDING SITE, designated SEQ ID:26084, to the nucleotide sequence of VGAM2419 RNA, herein designated VGAM RNA, also designated SEQ ID:5130.

[81850] Another function of VGAM2419 is therefore inhibition of MGC10911 (Accession NM_032302). Accordingly, utilities of VGAM2419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10911. Solute Carrier Family 38, Member 4 (SLC38A4, Accession NM_018018) is another VGAM2419 host target gene. SLC38A4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC38A4, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC38A4 BINDING SITE, designated SEQ ID:19758, to the nucleotide sequence of VGAM2419 RNA, herein designated VGAM RNA, also designated SEQ ID:5130.

[81851] Another function of VGAM2419 is therefore inhibition of Solute Carrier Family 38, Member 4 (SLC38A4, Accession NM_018018). Accordingly, utilities of VGAM2419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A4. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2420 (VGAM2420) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81852] VGAM2420 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2420 was detected is described hereinabove with reference to Figs. 1-8.

[81853] VGAM2420 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus.

VGAM2420 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81854] VGAM2420 gene encodes a VGAM2420 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2420 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2420 precursor RNA is designated SEQ ID:2406, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2406 is located at position 138753 relative to the genome of Goatpox Virus.

[81855] VGAM2420 precursor RNA folds onto itself, forming VGAM2420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81856] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2420 folded precursor RNA into VGAM2420 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2420 RNA is designated SEQ ID:5131, and is provided hereinbelow with reference to the sequence listing part.

[81857] VGAM2420 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2420 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2420 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81858] VGAM2420 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2420 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2420 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2420 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2420 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81859] The complementary binding of VGAM2420 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2420 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2420 host target RNA into VGAM2420 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81860] It is appreciated that VGAM2420 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2420 host target genes. The mRNA of each one of this plurality of VGAM2420 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2420 RNA, herein designated VGAM RNA, and which when bound by VGAM2420 RNA causes inhibition of translation of respective one or more VGAM2420 host target proteins.

[81861] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2420 gene, herein designated VGAM GENE, on one or more VGAM2420 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81862] It is yet further appreciated that a function of VGAM2420 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2420 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2420 correlate with, and may be deduced from, the identity of the host target genes which VGAM2420 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81863] Nucleotide sequences of the VGAM2420 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2420 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2420 are further described hereinbelow with reference to Table 1.

[81864] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2420 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2420 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81865] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2420 gene, herein designated VGAM is inhibition of expression of VGAM2420 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2420 correlate with, and may be deduced from, the identity of the target genes which VGAM2420 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81866] Ankyrin 2, Neuronal (ANK2, Accession NM_001148) is a VGAM2420 host target gene. ANK2 BINDING SITE1 and ANK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK2 BINDING SITE1 and ANK2 BINDING SITE2,

designated SEQ ID:6819 and SEQ ID:21963 respectively, to the nucleotide sequence of VGAM2420 RNA, herein designated VGAM RNA, also designated SEQ ID:5131.

[81867] A function of VGAM2420 is therefore inhibition of Ankyrin 2, Neuronal (ANK2, Accession NM_001148), a gene which attaches integral membrane proteins to cytoskeletal elements. also binds to cytoskeletal proteins. Accordingly, utilities of VGAM2420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK2. The function of ANK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM769.TEM8 (Accession NM_032208) is another VGAM2420 host target gene. TEM8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM8 BINDING SITE, designated SEQ ID:25915, to the nucleotide sequence of VGAM2420 RNA, herein designated VGAM RNA, also designated SEQ ID:5131.

[81868] Another function of VGAM2420 is therefore inhibition of

TEM8 (Accession NM_032208), a gene which is a tumor-specific endothelial marker. Accordingly, utilities of VGAM2420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM8. The function of TEM8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1489.Zinc Finger Protein 138 (clone pHZ-32) (ZNF138, Accession XM_088081) is another VGAM2420 host target gene. ZNF138 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF138 BINDING SITE, designated SEQ ID:39507, to the nucleotide sequence of VGAM2420 RNA, herein designated VGAM RNA, also designated SEQ ID:5131.

[81869] Another function of VGAM2420 is therefore inhibition of Zinc Finger Protein 138 (clone pHZ-32) (ZNF138, Accession XM_088081). Accordingly, utilities of VGAM2420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF138. PB1 (Accession

NM_018313) is another VGAM2420 host target gene. PB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PB1 BINDING SITE, designated SEQ ID:20306, to the nucleotide sequence of VGAM2420 RNA, herein designated VGAM RNA, also designated SEQ ID:5131.

[81870] Another function of VGAM2420 is therefore inhibition of PB1 (Accession NM_018313). Accordingly, utilities of VGAM2420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PB1. PRO2086 (Accession NM_014111) is another VGAM2420 host target gene. PRO2086 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2086 BINDING SITE, designated SEQ ID:15343, to the nucleotide sequence of VGAM2420 RNA, herein designated VGAM RNA, also designated SEQ ID:5131.

[81871] Another function of VGAM2420 is therefore inhibition of PRO2086 (Accession NM_014111). Accordingly, utilities of VGAM2420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2086. LOC154930 (Accession XM_088080) is another VGAM2420 host target gene. LOC154930 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154930 BINDING SITE, designated SEQ ID:39504, to the nucleotide sequence of VGAM2420 RNA, herein designated VGAM RNA, also designated SEQ ID:5131.

[81872] Another function of VGAM2420 is therefore inhibition of LOC154930 (Accession XM_088080). Accordingly, utilities of VGAM2420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154930. LOC199775 (Accession XM_114016) is another VGAM2420 host target gene. LOC199775 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199775, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199775 BINDING SITE, designated SEQ ID:42614, to the nucleotide sequence of VGAM2420 RNA, herein designated VGAM RNA, also designated SEQ ID:5131.

[81873] Another function of VGAM2420 is therefore inhibition of LOC199775 (Accession XM_114016). Accordingly, utilities of VGAM2420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199775. LOC51246 (Accession NM_016479) is another VGAM2420 host target gene. LOC51246 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51246 BINDING SITE, designated SEQ ID:18577, to the nucleotide sequence of VGAM2420 RNA, herein designated VGAM RNA, also designated SEQ ID:5131.

[81874] Another function of VGAM2420 is therefore inhibition of LOC51246 (Accession NM_016479). Accordingly, utilities of VGAM2420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC51246. LOC51652 (Accession NM_016079) is another VGAM2420 host target gene. LOC51652 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51652, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51652 BINDING SITE, designated SEQ ID:18150, to the nucleotide sequence of VGAM2420 RNA, herein designated VGAM RNA, also designated SEQ ID:5131.

[81875] Another function of VGAM2420 is therefore inhibition of LOC51652 (Accession NM_016079). Accordingly, utilities of VGAM2420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51652. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2421 (VGAM2421) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81876] VGAM2421 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2421 was detected is described hereinabove with reference to Figs. 1-8.

[81877] VGAM2421 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2421 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81878] VGAM2421 gene encodes a VGAM2421 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2421 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2421 precursor RNA is designated SEQ ID:2407, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2407 is located at position 87501 relative to the genome of Goatpox Virus.

[81879] VGAM2421 precursor RNA folds onto itself, forming VGAM2421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81880] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2421 folded precursor RNA into VGAM2421 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2421 RNA is designated SEQ ID:5132, and is provided hereinbelow with reference to the sequence listing part.

[81881] VGAM2421 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2421 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2421 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81882] VGAM2421 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2421 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2421 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2421 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2421 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81883] The complementary binding of VGAM2421 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2421 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2421 host target RNA into VGAM2421 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81884] It is appreciated that VGAM2421 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2421 host target genes. The mRNA of each one of this plurality of VGAM2421 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2421 RNA, herein designated VGAM RNA, and which when bound by VGAM2421 RNA causes inhibition of translation of respective one or more VGAM2421 host target proteins.

[81885] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2421 gene, herein designated VGAM GENE, on one or more VGAM2421 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81886] It is yet further appreciated that a function of VGAM2421 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2421 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2421 correlate with, and may be deduced from, the identity of the host target genes which VGAM2421 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81887] Nucleotide sequences of the VGAM2421 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2421 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2421 are further described hereinbelow with reference to Table 1.

[81888] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2421 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2421 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81889] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2421 gene, herein designated VGAM is inhibition of expression of VGAM2421 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2421 correlate with, and may be deduced from, the identity of the target genes which VGAM2421 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81890] Phosphatidylinositol Glycan, Class H (PIGH, Accession NM_004569) is a VGAM2421 host target gene. PIGH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIGH, correspond-

ing to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGH BINDING SITE, designated SEQ ID:10911, to the nucleotide sequence of VGAM2421 RNA, herein designated VGAM RNA, also designated SEQ ID:5132.

[81891] A function of VGAM2421 is therefore inhibition of Phosphatidylinositol Glycan, Class H (PIGH, Accession NM_004569), a gene which catalyzes transfer of GlcNAc to PI. Accordingly, utilities of VGAM2421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGH. The function of PIGH has been established by previous studies. The PIGH gene encodes an enzyme involved in the biosynthesis of glycosylphosphatidylinositol anchor; see PIGA (OMIM Ref. No. 311770) and PIGF (OMIM Ref. No. 600153) for other components of the system. Kamitani et al. (1993) isolated cDNA for a human gene that repaired the defect in a complementation class H mutant cell line. They determined that PIGH encodes a predicted protein of 188 amino acids. Ware et al. (1994) demonstrated that the mouse Pigh gene is located on chromosome 12 in a region of homology of synteny with 14q11-q24. Watanabe et al. (1996) demonstrated

that the PIGA and PIGH proteins form a protein complex and are subunits of the GPI GlcNAc transferase of the endoplasmic reticulum (ER). They showed that PIGH is a cytoplasmic ER-associated protein. Using immunoprecipitation experiments, Watanabe et al. (1998) demonstrated that PIGQ (OMIM Ref. No. 605754) associates specifically with PIGA, PIGC (OMIM Ref. No. 601730), and PIGH and that all 4 proteins form a complex that has GPI-GlcNAc transferase (GPI-GnT) activity in vitro

[81892] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[81893] Watanabe, R.; Inoue, N.; Westfall, B.; Taron, C. H.; Orlean, P.; Takeda, J.; Kinoshita, T. : The first step of glycosylphosphatidylinositol biosynthesis is mediated by a complex of PIG-A, PIG-H, PIG-C and GPI1. EMBO J. 17: 877-885, 1998. ; and

[81894] Watanabe, R.; Kinoshita, T.; Masaki, R.; Yamamoto, A.; Takeda, J.; Inoue, N. : PIG-A and PIG-H, which participate in glycosylphosphatidylinositol anchor biosynthesis, form a protein comp.

[81895] Further studies establishing the function and utilities of PIGH are found in John Hopkins OMIM database record ID

600154, and in sited publications numbered 133 and 8105-8107 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.DCMP Deaminase (DCTD, Accession NM_001921) is another VGAM2421 host target gene. DCTD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCTD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCTD BINDING SITE, designated SEQ ID:7636, to the nucleotide sequence of VGAM2421 RNA, herein designated VGAM RNA, also designated SEQ ID:5132.

[81896] Another function of VGAM2421 is therefore inhibition of DCMP Deaminase (DCTD, Accession NM_001921). Accordingly, utilities of VGAM2421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCTD. FLJ14906 (Accession NM_032859) is another VGAM2421 host target gene. FLJ14906 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ14906 BINDING SITE, designated SEQ ID:26664, to the nucleotide sequence of VGAM2421 RNA, herein designated VGAM RNA, also designated SEQ ID:5132.

[81897] Another function of VGAM2421 is therefore inhibition of FLJ14906 (Accession NM_032859). Accordingly, utilities of VGAM2421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14906. LOC138389 (Accession XM_072534) is another VGAM2421 host target gene. LOC138389 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138389 BINDING SITE, designated SEQ ID:37503, to the nucleotide sequence of VGAM2421 RNA, herein designated VGAM RNA, also designated SEQ ID:5132.

[81898] Another function of VGAM2421 is therefore inhibition of LOC138389 (Accession XM_072534). Accordingly, utilities of VGAM2421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138389. LOC145622 (Accession XM_085186) is an-

other VGAM2421 host target gene. LOC145622 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE, designated SEQ ID:37916, to the nucleotide sequence of VGAM2421 RNA, herein designated VGAM RNA, also designated SEQ ID:5132.

[81899] Another function of VGAM2421 is therefore inhibition of LOC145622 (Accession XM_085186). Accordingly, utilities of VGAM2421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145622. LOC54499 (Accession XM_047479) is another VGAM2421 host target gene. LOC54499 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC54499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54499 BINDING SITE, designated SEQ ID:34968, to the nucleotide sequence of VGAM2421 RNA, herein designated VGAM RNA, also designated SEQ ID:5132.

[81900] Another function of VGAM2421 is therefore inhibition of LOC54499 (Accession XM_047479). Accordingly, utilities of VGAM2421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54499. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2422 (VGAM2422) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81901] VGAM2422 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2422 was detected is described hereinabove with reference to Figs. 1-8.

[81902] VGAM2422 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2422 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81903] VGAM2422 gene encodes a VGAM2422 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2422 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2422 precursor RNA is designated SEQ ID:2408, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2408 is located at position 83441 relative to the genome of Goatpox Virus.

[81904] VGAM2422 precursor RNA folds onto itself, forming VGAM2422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81905] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2422 folded precursor RNA into VGAM2422 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2422 RNA is designated SEQ ID:5133, and is provided hereinbelow with reference to the sequence listing part.

[81906] VGAM2422 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2422 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2422 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81907] VGAM2422 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2422 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2422 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2422 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2422 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81908] The complementary binding of VGAM2422 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2422 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2422 host target RNA into VGAM2422 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81909] It is appreciated that VGAM2422 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2422 host target genes. The mRNA of each one of this plurality of VGAM2422 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2422 RNA, herein designated VGAM RNA, and which when bound by VGAM2422 RNA causes inhibition of translation of respective one or more VGAM2422 host target proteins.

[81910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2422 gene, herein designated VGAM GENE, on one or more VGAM2422 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81911] It is yet further appreciated that a function of VGAM2422 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2422 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2422 correlate with, and may be deduced from, the identity of the host target genes which VGAM2422 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81912] Nucleotide sequences of the VGAM2422 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2422 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2422 are further described hereinbelow with reference to Table 1.

[81913] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2422 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2422 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[81914] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2422 gene, herein designated VGAM is inhibition of expression of VGAM2422 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2422 correlate with, and may be deduced from, the identity of the target genes which VGAM2422 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81915] N-ethylmaleimide-sensitive Factor Attachment Protein, Beta (NAPB, Accession XM_046652) is a VGAM2422 host target gene. NAPB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NAPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAPB BINDING SITE, designated SEQ ID:34765, to the nucleotide sequence of VGAM2422 RNA, herein designated VGAM RNA, also designated SEQ ID:5133.

[81916] A function of VGAM2422 is therefore inhibition of N-ethylmaleimide-sensitive Factor Attachment Protein, Beta (NAPB, Accession XM_046652). Accordingly, utilities of

VGAM2422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAPB. NCK-associated Protein 1 (NCKAP1, Accession NM_013436) is another VGAM2422 host target gene. NCKAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCKAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCKAP1 BINDING SITE, designated SEQ ID:15094, to the nucleotide sequence of VGAM2422 RNA, herein designated VGAM RNA, also designated SEQ ID:5133.

[81917] Another function of VGAM2422 is therefore inhibition of NCK-associated Protein 1 (NCKAP1, Accession NM_013436). Accordingly, utilities of VGAM2422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCKAP1. ATPase, Class V, Type 10D (ATP10D, Accession XM_054907) is another VGAM2422 host target gene. ATP10D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP10D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10D BINDING SITE, designated SEQ ID:36199, to the nucleotide sequence of VGAM2422 RNA, herein designated VGAM RNA, also designated SEQ ID:5133.

[81918] Another function of VGAM2422 is therefore inhibition of ATPase, Class V, Type 10D (ATP10D, Accession XM_054907). Accordingly, utilities of VGAM2422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10D. FLJ12085 (Accession NM_022771) is another VGAM2422 host target gene. FLJ12085 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12085 BINDING SITE, designated SEQ ID:23031, to the nucleotide sequence of VGAM2422 RNA, herein designated VGAM RNA, also designated SEQ ID:5133.

[81919] Another function of VGAM2422 is therefore inhibition of FLJ12085 (Accession NM_022771). Accordingly, utilities of VGAM2422 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12085. SCLY (Accession NM_016510) is another VGAM2422 host target gene. SCLY BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCLY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCLY BINDING SITE, designated SEQ ID:18587, to the nucleotide sequence of VGAM2422 RNA, herein designated VGAM RNA, also designated SEQ ID:5133.

[81920] Another function of VGAM2422 is therefore inhibition of SCLY (Accession NM_016510). Accordingly, utilities of VGAM2422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCLY. LOC143879 (Accession XM_084666) is another VGAM2422 host target gene. LOC143879 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143879 BINDING SITE, designated SEQ ID:37657, to

the nucleotide sequence of VGAM2422 RNA, herein designated VGAM RNA, also designated SEQ ID:5133.

[81921] Another function of VGAM2422 is therefore inhibition of LOC143879 (Accession XM_084666). Accordingly, utilities of VGAM2422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143879. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2423 (VGAM2423) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81922] VGAM2423 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2423 was detected is described hereinabove with reference to Figs. 1-8.

[81923] VGAM2423 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus.
VGAM2423 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81924] VGAM2423 gene encodes a VGAM2423 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2423 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2423 precursor RNA is designated SEQ ID:2409, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2409 is located at position 74429 relative to the genome of Goatpox Virus.

[81925] VGAM2423 precursor RNA folds onto itself, forming VGAM2423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81926] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2423 folded precursor RNA into VGAM2423 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2423 RNA is designated SEQ ID:5134, and is provided hereinbelow with reference to the sequence listing part.

[81927] VGAM2423 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2423 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2423 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81928] VGAM2423 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2423 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2423 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2423 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2423 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81929] The complementary binding of VGAM2423 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2423 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2423 host target RNA into VGAM2423 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81930] It is appreciated that VGAM2423 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2423 host target genes. The mRNA of each one of this plurality of VGAM2423 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2423 RNA, herein designated VGAM RNA, and which when bound by VGAM2423 RNA causes inhibition of translation of respective one or more VGAM2423 host target proteins.

[81931] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2423 gene, herein designated VGAM GENE, on one or more VGAM2423 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81932] It is yet further appreciated that a function of VGAM2423 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2423 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2423 correlate with, and may be deduced from, the identity of the host target genes which VGAM2423 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81933] Nucleotide sequences of the VGAM2423 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2423 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2423 are further described hereinbelow with reference to Table 1.

[81934] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2423 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2423 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81935] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2423 gene, herein designated VGAM is inhibition of expression of VGAM2423 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2423 correlate with, and may be deduced from, the identity of the target genes which VGAM2423 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81936] Interleukin 17 (cytotoxic T-lymphocyte-associated serine esterase 8) (IL17, Accession NM_002190) is a VGAM2423 host target gene. IL17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL17 BINDING SITE, designated SEQ ID:7947, to the nucleotide sequence of VGAM2423 RNA, herein designated VGAM RNA, also designated SEQ ID:5134.

[81937] A function of VGAM2423 is therefore inhibition of Inter-

leukin 17 (cytotoxic T-lymphocyte-associated serine esterase 8) (IL17, Accession NM_002190), a gene which induces stromal cells to produce proinflammatory and hematopoietic cytokines. Accordingly, utilities of VGAM2423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL17. The function of IL17 has been established by previous studies. Rouvier et al. (1993) used subtractive library screening to isolate a novel rodent gene, termed CTLA8, that was expressed specifically in cytotoxic T cells. Although Rouvier et al. (1993) described CTLA8 as a mouse gene, Kennedy et al. (1996) showed that it is actually the rat IL17 homolog. Rouvier et al. (1993) noted that the CTLA8 polypeptide sequence is 56.8% identical to that of the immediate-early gene 13 of Herpesvirus saimiri (OMIM Ref. No. HVS-13). The CTLA8 3-prime untranslated region contains AU-rich repeats typically found in the mRNA of cytokines and growth factors. Yao et al. (1995) cloned a human IL17 cDNA. The cDNA encodes a 155-amino acid polypeptide that contains an N-terminal hydrophobic signal sequence. Northern blot analysis revealed that the gene is expressed as a 1.9-kb mRNA in stimulated, but not resting, T cells; the transcript could not be detected in

any human tissues. Expressed recombinant IL17 was secreted in both glycosylated and nonglycosylated forms. IL17 protein applied to fibroblasts induced the production of IL6 (OMIM Ref. No. 147620) and IL8 (OMIM Ref. No. 146930) and enhanced surface expression of intracellular adhesion molecule-1 (ICAM1; 147840).

[81938] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[81939] Kennedy, J.; Rossi, D. L.; Zurawski, S. M.; Vega, F., Jr. : Kastelein, R. A.; Wagner, J. L.; Hannum, C. H.; Zlotnick, A.: Mouse IL-17: a cytokine preferentially expressed by alpha beta TCR + CD4-CD8-T cells. J. Interferon Cytokine Res. 16: 611-617, 1996. ; and

[81940] Yao, Z.; Painter, S. L.; Fanslow, W. C.; Ulrich, D.; Macduff, B. M.; Spriggs, M. K.; Armitage, R. J. : Human IL-17: a novel cytokine derived from T cells. J. Immun. 155: 5483-5486, 1995.

[81941] Further studies establishing the function and utilities of IL17 are found in John Hopkins OMIM database record ID 603149, and in sited publications numbered 5428-5431 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FK506 Binding Pro-

tein 5 (FKBP5, Accession NM_004117) is another VGAM2423 host target gene. FKBP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP5 BINDING SITE, designated SEQ ID:10326, to the nucleotide sequence of VGAM2423 RNA, herein designated VGAM RNA, also designated SEQ ID:5134.

[81942] Another function of VGAM2423 is therefore inhibition of FK506 Binding Protein 5 (FKBP5, Accession NM_004117). Accordingly, utilities of VGAM2423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP5. KIAA1383 (Accession XM_045859) is another VGAM2423 host target gene. KIAA1383 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1383, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1383 BINDING SITE, designated SEQ ID:34584, to the nucleotide sequence of VGAM2423 RNA,

herein designated VGAM RNA, also designated SEQ ID:5134.

[81943] Another function of VGAM2423 is therefore inhibition of KIAA1383 (Accession XM_045859). Accordingly, utilities of VGAM2423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1383. Phospholipase A2, Group III (PLA2G3, Accession NM_015715) is another VGAM2423 host target gene. PLA2G3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLA2G3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G3 BINDING SITE, designated SEQ ID:17929, to the nucleotide sequence of VGAM2423 RNA, herein designated VGAM RNA, also designated SEQ ID:5134.

[81944] Another function of VGAM2423 is therefore inhibition of Phospholipase A2, Group III (PLA2G3, Accession NM_015715). Accordingly, utilities of VGAM2423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G3. LOC120103 (Accession XM_058449) is another VGAM2423 host target

gene. LOC120103 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120103 BINDING SITE, designated SEQ ID:36618, to the nucleotide sequence of VGAM2423 RNA, herein designated VGAM RNA, also designated SEQ ID:5134.

[81945] Another function of VGAM2423 is therefore inhibition of LOC120103 (Accession XM_058449). Accordingly, utilities of VGAM2423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120103. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2424 (VGAM2424) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81946] VGAM2424 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2424 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[81947] VGAM2424 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2424 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81948] VGAM2424 gene encodes a VGAM2424 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2424 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2424 precursor RNA is designated SEQ ID:2410, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2410 is located at position 134679 relative to the genome of Goatpox Virus.

[81949] VGAM2424 precursor RNA folds onto itself, forming VGAM2424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81950] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2424 folded precursor RNA into VGAM2424 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2424 RNA is designated SEQ ID:5135, and is provided hereinbelow with reference to the sequence listing part.

[81951] VGAM2424 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2424 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2424 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81952] VGAM2424 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2424 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2424 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2424 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2424 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81953] The complementary binding of VGAM2424 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2424 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2424 host target RNA into VGAM2424 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81954] It is appreciated that VGAM2424 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2424 host target genes. The mRNA of each one of this plurality of VGAM2424 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2424 RNA, herein designated VGAM RNA, and which when bound by VGAM2424 RNA causes inhibition of translation of respective one or more VGAM2424 host target proteins.

[81955] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2424 gene, herein designated VGAM GENE, on one or more VGAM2424 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81956] It is yet further appreciated that a function of VGAM2424 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2424 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2424 correlate with, and may be deduced from, the identity of the host target genes which VGAM2424 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81957] Nucleotide sequences of the VGAM2424 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2424 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2424 are further described hereinbelow with reference to Table 1.

[81958] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2424 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2424 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81959] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2424 gene, herein designated VGAM is inhibition of expression of VGAM2424 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2424 correlate with, and may be deduced from, the identity of the target genes which VGAM2424 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81960] Exostoses (multiple) 2 (EXT2, Accession NM_000401) is a VGAM2424 host target gene. EXT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EXT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXT2 BINDING SITE, designated SEQ ID:5977, to the nucleotide sequence of VGAM2424 RNA, herein designated VGAM RNA, also designated SEQ ID:5135.

[81961] A function of VGAM2424 is therefore inhibition of Exostoses (multiple) 2 (EXT2, Accession NM_000401). Accordingly, utilities of VGAM2424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXT2. FLJ23047 (Accession NM_024548) is another VGAM2424 host target gene. FLJ23047 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23047 BINDING SITE, designated SEQ ID:23761, to the nucleotide sequence of VGAM2424 RNA, herein designated VGAM RNA, also designated SEQ ID:5135.

[81962] Another function of VGAM2424 is therefore inhibition of FLJ23047 (Accession NM_024548). Accordingly, utilities of VGAM2424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ23047. Hect Domain and RLD 3 (HERC3, Accession NM_014606) is another VGAM2424 host target gene. HERC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HERC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HERC3 BINDING SITE, designated SEQ ID:15970, to the nucleotide sequence of VGAM2424 RNA, herein designated VGAM RNA, also designated SEQ ID:5135.

[81963] Another function of VGAM2424 is therefore inhibition of Hect Domain and RLD 3 (HERC3, Accession NM_014606). Accordingly, utilities of VGAM2424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HERC3. LOC200933 (Accession XM_117294) is another VGAM2424 host target gene. LOC200933 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200933, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200933 BINDING SITE, desig-

nated SEQ ID:43361, to the nucleotide sequence of VGAM2424 RNA, herein designated VGAM RNA, also designated SEQ ID:5135.

[81964] Another function of VGAM2424 is therefore inhibition of LOC200933 (Accession XM_117294). Accordingly, utilities of VGAM2424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200933. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2425 (VGAM2425) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[81965] VGAM2425 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2425 was detected is described hereinabove with reference to Figs. 1-8.

[81966] VGAM2425 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2425 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81967] VGAM2425 gene encodes a VGAM2425 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2425 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2425 precursor RNA is designated SEQ ID:2411, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2411 is located at position 148298 relative to the genome of Goatpox Virus.

[81968] VGAM2425 precursor RNA folds onto itself, forming VGAM2425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81969] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2425 folded precursor RNA into VGAM2425 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2425 RNA is designated SEQ ID:5136, and is provided hereinbelow with reference to the sequence listing part.

[81970] VGAM2425 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2425 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2425 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81971] VGAM2425 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2425 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2425 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2425 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2425 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[81972] The complementary binding of VGAM2425 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2425 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2425 host target RNA into VGAM2425 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81973] It is appreciated that VGAM2425 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2425 host target genes. The mRNA of each one of this plurality of VGAM2425 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2425 RNA, herein designated VGAM RNA, and which when bound by VGAM2425 RNA causes inhibition of translation of respective one or more VGAM2425 host target proteins.

[81974] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2425 gene, herein designated VGAM GENE, on one or more VGAM2425 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[81975] It is yet further appreciated that a function of VGAM2425 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2425 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2425 correlate with, and may be deduced from, the identity of the host target genes which VGAM2425 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[81976] Nucleotide sequences of the VGAM2425 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2425 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2425 are further described hereinbelow with reference to Table 1.

[81977] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2425 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2425 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[81978] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2425 gene, herein designated VGAM is inhibition of expression of VGAM2425 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2425 correlate with, and may be deduced from, the identity of the target genes which VGAM2425 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[81979] Carbonic Anhydrase III, Muscle Specific (CA3, Accession NM_005181) is a VGAM2425 host target gene. CA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CA3 BINDING SITE, designated SEQ ID:11679, to the nucleotide sequence of VGAM2425 RNA, herein designated VGAM RNA, also designated SEQ ID:5136.

[81980] A function of VGAM2425 is therefore inhibition of Car-

bonic Anhydrase III, Muscle Specific (CA3, Accession NM_005181), a gene which has a muscle-specific function of reversible hydratation of carbon dioxide. Accordingly, utilities of VGAM2425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA3. The function of CA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1911.Fas (TNFRSF6)-associated Via Death Domain (FADD, Accession NM_003824) is another VGAM2425 host target gene. FADD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FADD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FADD BINDING SITE, designated SEQ ID:9917, to the nucleotide sequence of VGAM2425 RNA, herein designated VGAM RNA, also designated SEQ ID:5136.

[81981] Another function of VGAM2425 is therefore inhibition of Fas (TNFRSF6)-associated Via Death Domain (FADD, Accession NM_003824), a gene which may play an important role in the proximal signal transduction of FAS. Accord-

ingly, utilities of VGAM2425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FADD. The function of FADD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM995.DKFZP547E2110 (Accession XM_165676) is another VGAM2425 host target gene. DKFZP547E2110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP547E2110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP547E2110 BINDING SITE, designated SEQ ID:43732, to the nucleotide sequence of VGAM2425 RNA, herein designated VGAM RNA, also designated SEQ ID:5136.

[81982] Another function of VGAM2425 is therefore inhibition of DKFZP547E2110 (Accession XM_165676). Accordingly, utilities of VGAM2425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP547E2110. KIAA0767 (Accession XM_027105) is another VGAM2425 host target gene. KIAA0767 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by KIAA0767, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0767 BINDING SITE, designated SEQ ID:30409, to the nucleotide sequence of VGAM2425 RNA, herein designated VGAM RNA, also designated SEQ ID:5136.

[81983] Another function of VGAM2425 is therefore inhibition of KIAA0767 (Accession XM_027105). Accordingly, utilities of VGAM2425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0767. KIAA1464 (Accession XM_043069) is another VGAM2425 host target gene. KIAA1464 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1464 BINDING SITE, designated SEQ ID:33886, to the nucleotide sequence of VGAM2425 RNA, herein designated VGAM RNA, also designated SEQ ID:5136.

[81984] Another function of VGAM2425 is therefore inhibition of KIAA1464 (Accession XM_043069). Accordingly, utilities

of VGAM2425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1464. LOC122830 (Accession XM_058661) is another VGAM2425 host target gene. LOC122830 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC122830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122830 BINDING SITE, designated SEQ ID:36709, to the nucleotide sequence of VGAM2425 RNA, herein designated VGAM RNA, also designated SEQ ID:5136.

[81985] Another function of VGAM2425 is therefore inhibition of LOC122830 (Accession XM_058661). Accordingly, utilities of VGAM2425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122830. LOC144481 (Accession XM_096611) is another VGAM2425 host target gene. LOC144481 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC144481 BINDING SITE, designated SEQ ID:40419, to the nucleotide sequence of VGAM2425 RNA, herein designated VGAM RNA, also designated SEQ ID:5136.

[81986] Another function of VGAM2425 is therefore inhibition of LOC144481 (Accession XM_096611). Accordingly, utilities of VGAM2425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144481. LOC144501 (Accession XM_096612) is another VGAM2425 host target gene. LOC144501 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144501 BINDING SITE, designated SEQ ID:40421, to the nucleotide sequence of VGAM2425 RNA, herein designated VGAM RNA, also designated SEQ ID:5136.

[81987] Another function of VGAM2425 is therefore inhibition of LOC144501 (Accession XM_096612). Accordingly, utilities of VGAM2425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144501. LOC168667 (Accession XM_166592) is another VGAM2425 host target gene. LOC168667 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC168667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168667 BINDING SITE, designated SEQ ID:44564, to the nucleotide sequence of VGAM2425 RNA, herein designated VGAM RNA, also designated SEQ ID:5136.

[81988] Another function of VGAM2425 is therefore inhibition of LOC168667 (Accession XM_166592). Accordingly, utilities of VGAM2425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168667. LOC254045 (Accession XM_172882) is another VGAM2425 host target gene. LOC254045 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254045 BINDING SITE, designated SEQ ID:46161, to the nucleotide sequence of VGAM2425 RNA, herein designated VGAM RNA, also designated SEQ ID:5136.

[81989] Another function of VGAM2425 is therefore inhibition of

LOC254045 (Accession XM_172882). Accordingly, utilities of VGAM2425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254045. LOC51068 (Accession NM_015938) is another VGAM2425 host target gene. LOC51068 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51068, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51068 BINDING SITE, designated SEQ ID:18058, to the nucleotide sequence of VGAM2425 RNA, herein designated VGAM RNA, also designated SEQ ID:5136.

[81990] Another function of VGAM2425 is therefore inhibition of LOC51068 (Accession NM_015938). Accordingly, utilities of VGAM2425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51068. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2426 (VGAM2426) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[81991] VGAM2426 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2426 was detected is described hereinabove with reference to Figs. 1-8.

[81992] VGAM2426 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2426 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[81993] VGAM2426 gene encodes a VGAM2426 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2426 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2426 precursor RNA is designated SEQ ID:2412, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2412 is located at position 51036 relative to the genome of Goatpox Virus.

[81994] VGAM2426 precursor RNA folds onto itself, forming VGAM2426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[81995] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2426 folded precursor RNA into VGAM2426 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2426 RNA is designated SEQ ID:5137, and is provided hereinbelow with reference to the sequence listing part.

[81996] VGAM2426 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2426 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2426 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[81997] VGAM2426 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2426 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2426 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2426 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2426 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[81998] The complementary binding of VGAM2426 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2426 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2426 host target RNA into VGAM2426 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[81999] It is appreciated that VGAM2426 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2426 host target genes. The mRNA of each one of this plurality of VGAM2426 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2426 RNA, herein designated VGAM RNA, and which when bound by VGAM2426 RNA causes inhibition of translation of respective one or more VGAM2426 host target proteins.

[82000] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2426 gene, herein designated VGAM GENE, on one

or more VGAM2426 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82001] It is yet further appreciated that a function of VGAM2426 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2426 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2426 correlate with, and may be deduced from, the identity of the host target genes which VGAM2426 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82002] Nucleotide sequences of the VGAM2426 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2426 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2426 are further described hereinbelow with reference to Table 1.

[82003] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2426 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2426 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82004] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2426 gene, herein designated VGAM is inhibition of expression of VGAM2426 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2426 correlate with, and may be deduced from, the identity of the target genes which VGAM2426 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82005] Archain 1 (ARCN1, Accession NM_001655) is a VGAM2426

host target gene. ARCN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARCN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARCN1 BINDING SITE, designated SEQ ID:7366, to the nucleotide sequence of VGAM2426 RNA, herein designated VGAM RNA, also designated SEQ ID:5137.

[82006] A function of VGAM2426 is therefore inhibition of Archain 1 (ARCN1, Accession NM_001655), a gene which plays a fundamental role in eukaryotic cell biology. Accordingly, utilities of VGAM2426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARCN1. The function of ARCN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1226.Retinoblastoma 1 (including osteosarcoma) (RB1, Accession XM_165641) is another VGAM2426 host target gene. RB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RB1 BINDING SITE, designated SEQ ID:43704, to the nucleotide sequence of VGAM2426 RNA, herein designated VGAM RNA, also designated SEQ ID:5137.

[82007] Another function of VGAM2426 is therefore inhibition of Retinoblastoma 1 (including osteosarcoma) (RB1, Accession XM_165641), a gene which probably acts as a regulator of other genes. Accordingly, utilities of VGAM2426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RB1. The function of RB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM795.MCJ (Accession NM_013238) is another VGAM2426 host target gene. MCJ BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MCJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCJ BINDING SITE, designated SEQ ID:14898, to the nucleotide sequence of VGAM2426 RNA, herein designated VGAM RNA, also designated SEQ ID:5137.

[82008] Another function of VGAM2426 is therefore inhibition of MCJ (Accession NM_013238). Accordingly, utilities of VGAM2426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCJ. PLU-1 (Accession XM_113375) is another VGAM2426 host target gene. PLU-1 BINDING SITE1 and PLU-1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PLU-1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLU-1 BINDING SITE1 and PLU-1 BINDING SITE2, designated SEQ ID:42251 and SEQ ID:13402 respectively, to the nucleotide sequence of VGAM2426 RNA, herein designated VGAM RNA, also designated SEQ ID:5137.

[82009] Another function of VGAM2426 is therefore inhibition of PLU-1 (Accession XM_113375). Accordingly, utilities of VGAM2426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLU-1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2427 (VGAM2427) viral gene, which modulates expression

of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82010] VGAM2427 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2427 was detected is described hereinabove with reference to Figs. 1-8.

[82011] VGAM2427 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2427 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82012] VGAM2427 gene encodes a VGAM2427 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2427 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2427 precursor RNA is designated SEQ ID:2413, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2413 is located at position 48019 relative to the genome of Goatpox Virus.

[82013] VGAM2427 precursor RNA folds onto itself, forming VGAM2427 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82014] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2427 folded precursor RNA into VGAM2427 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2427 RNA is designated SEQ ID:5138, and is provided hereinbelow with reference to the sequence listing part.

[82015] VGAM2427 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2427 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2427 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82016] VGAM2427 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2427 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2427 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2427 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2427 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82017] The complementary binding of VGAM2427 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2427 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2427 host target RNA into VGAM2427 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82018] It is appreciated that VGAM2427 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2427 host target genes. The mRNA of each one of this plurality of VGAM2427 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2427 RNA, herein designated VGAM RNA, and which when bound by VGAM2427 RNA causes inhibition of translation of respective one or more VGAM2427 host target proteins.

[82019] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2427 gene, herein designated VGAM GENE, on one or more VGAM2427 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82020] It is yet further appreciated that a function of VGAM2427 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2427 correlate with, and may be deduced from, the identity of the host target genes which VGAM2427 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[82021] Nucleotide sequences of the VGAM2427 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2427 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2427 are further described hereinbelow with reference to Table 1.

[82022] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2427 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2427 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82023] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2427 gene, herein designated VGAM is inhibition of expression of VGAM2427 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2427 correlate with, and may be deduced from, the identity of the target genes which VGAM2427 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82024] ATP-binding Cassette, Sub-family D (ALD), Member 2 (ABCD2, Accession NM_005164) is a VGAM2427 host target gene. ABCD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD2 BINDING SITE, designated SEQ ID:11658, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82025] A function of VGAM2427 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 2 (ABCD2, Accession NM_005164), a gene which probable transporter. Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD2. The function of ABCD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229.NAD(P)H Dehydrogenase, Quinone 1 (NQO1, Accession NM_000903) is another VGAM2427 host target gene. NQO1 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by NQO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NQO1 BINDING SITE, designated SEQ ID:6606, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82026] Another function of VGAM2427 is therefore inhibition of NAD(P)H Dehydrogenase, Quinone 1 (NQO1, Accession NM_000903), a gene which is cytochrome b5 reductase which reduces redox dyes and quinones. Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NQO1. The function of NQO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923.RAB18, Member RAS Oncogene Family (RAB18, Accession NM_021252) is another VGAM2427 host target gene. RAB18 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of RAB18 BINDING SITE, designated SEQ ID:22224, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82027] Another function of VGAM2427 is therefore inhibition of RAB18, Member RAS Oncogene Family (RAB18, Accession NM_021252), a gene which plays a role in apical endocytosis/recycling. Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB18. The function of RAB18 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.RAD23 Homolog B (S. cerevisiae) (RAD23B, Accession NM_002874) is another VGAM2427 host target gene. RAD23B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAD23B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD23B BINDING SITE, designated SEQ ID:8785, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ

ID:5138.

[82028] Another function of VGAM2427 is therefore inhibition of RAD23 Homolog B (S. cerevisiae) (RAD23B, Accession NM_002874), a gene which is involved in dna excision repair. Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD23B. The function of RAD23B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.REV3-like, Catalytic Subunit of DNA Polymerase Zeta (yeast) (REV3L, Accession NM_002912) is another VGAM2427 host target gene. REV3L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by REV3L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REV3L BINDING SITE, designated SEQ ID:8816, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82029] Another function of VGAM2427 is therefore inhibition of REV3-like, Catalytic Subunit of DNA Polymerase Zeta

(yeast) (REV3L, Accession NM_002912), a gene which is a catalytic subunit of DNA polymerase zeta and acts in translation replication and mutagenesis. Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REV3L. The function of REV3L has been established by previous studies. To get a better understanding of mutagenic mechanisms in humans, Gibbs et al. (1998) cloned and sequenced the human homolog of the Saccharomyces cerevisiae REV3 gene. The yeast gene encodes the catalytic subunit of DNA polymerase zeta, a nonessential enzyme that is thought to carry out translesion replication and is responsible for virtually all DNA damage-induced mutagenesis and the majority of spontaneous mutagenesis. The human gene encodes an expected protein of 3,130 residues, about twice the size of the yeast protein, which has 1,504 amino acids. The 2 proteins are 29% identical in an amino-terminal region of approximately 340 residues, 39% identical in a carboxy-terminal region of approximately 850 residues, and 29% identical in a 55-residue region in the middle of the 2 genes. The sequence of the expected protein strongly predicted that it is the catalytic subunit of a DNA polymerase of the poly-

merase-zeta type; the carboxy-terminal domain possesses, in the right order, the 6 motifs characteristic of eukaryotic DNA polymerases, most closely resembles yeast polymerase-zeta among all polymerases in the GenBank database, and is different from the human alpha (POLA; 312040), delta (POLD1; 174761), and epsilon (POLE; 174762) enzymes. Human cells expressing high levels of an REV3 antisense RNA fragment grow normally, but show little or no UV-induced mutagenesis and are slightly more sensitive to killing by UV. The human gene therefore appears to carry out a function similar to that of its yeast counterpart. Xiao et al. (1998) identified human cDNA clones from 3 different libraries whose deduced amino acid sequences bore remarkable homology to yeast REV3. By in situ hybridization, they mapped the human REV3 gene to 1p33-p32. The gene encodes an mRNA of more than 10 kb. Its expression varies in different tissues and appeared to be elevated in some but not all of the tumor cell lines examined. In a study of genes involved in tumor suppression from 6q21, Morelli et al. (1998) identified the same sequence as that reported by Gibbs et al. (1998). The REV3L gene contains 33 exons (3 noncoding at the 5-prime end) and spans approximately 200 kb of

genomic DNA. The chromosome 6 assignment is the more likely (AFS).

[82030] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[82031] Gibbs, P. E. M.; McGregor, W. G.; Maher, V. M.; Nisson, P.; Lawrence, C. W. : A human homolog of the Saccharomyces cerevisiae REV3 gene, which encodes the catalytic subunit of DNA polymerase zeta. Proc. Nat. Acad. Sci. 95: 6876-6880, 1998. ; and

[82032] Xiao, W.; Lechler, T.; Chow, B. L.; Fontanie, T.; Agustus, M.; Carter, K. C.; Wei, Y.-F. : Identification, chromosomal mapping and tissue-specific expression of hREV3 encoding a putativ.

[82033] Further studies establishing the function and utilities of REV3L are found in John Hopkins OMIM database record ID 602776, and in sited publications numbered 7650-7652 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Tumor Necrosis Factor Receptor Superfamily, Member 9 (TNFRSF9, Accession NM_001561) is another VGAM2427 host target gene. TNFRSF9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by TNFRSF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF9 BINDING SITE, designated SEQ ID:7291, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82034] Another function of VGAM2427 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 9 (TNFRSF9, Accession NM_001561), a gene which inhibits proliferation of activated T lymphocytes. Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF9. The function of TNFRSF9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1954.Activin A Receptor, Type II (ACVR2, Accession NM_001616) is another VGAM2427 host target gene. ACVR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACVR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ACVR2 BINDING SITE, designated SEQ ID:7322, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82035] Another function of VGAM2427 is therefore inhibition of Activin A Receptor, Type II (ACVR2, Accession NM_001616). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACVR2. Chromosome 9 Open Reading Frame 14 (C9orf14, Accession XM_098859) is another VGAM2427 host target gene. C9orf14 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C9orf14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf14 BINDING SITE, designated SEQ ID:41913, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82036] Another function of VGAM2427 is therefore inhibition of Chromosome 9 Open Reading Frame 14 (C9orf14, Accession XM_098859). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with C9orf14. DKFZP586M0622 (Accession NM_015583) is another VGAM2427 host target gene. DKFZP586M0622 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP586M0622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586M0622 BINDING SITE, designated SEQ ID:17850, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82037] Another function of VGAM2427 is therefore inhibition of DKFZP586M0622 (Accession NM_015583). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M0622. FLJ10697 (Accession NM_018181) is another VGAM2427 host target gene. FLJ10697 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ10697 BINDING SITE, designated SEQ ID:20017, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82038] Another function of VGAM2427 is therefore inhibition of FLJ10697 (Accession NM_018181). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10697. FLJ13057 (Accession XM_171006) is another VGAM2427 host target gene. FLJ13057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13057 BINDING SITE, designated SEQ ID:45778, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82039] Another function of VGAM2427 is therefore inhibition of FLJ13057 (Accession XM_171006). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13057. KIAA0121 (Accession XM_052386) is another VGAM2427 host target gene. KIAA0121 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0121 BINDING SITE, designated SEQ ID:35973, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82040] Another function of VGAM2427 is therefore inhibition of KIAA0121 (Accession XM_052386). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0121. KIAA0265 (Accession XM_045954) is another VGAM2427 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:34622, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82041] Another function of VGAM2427 is therefore inhibition of

KIAA0265 (Accession XM_045954). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265. KIAA1948 (Accession XM_091984) is another VGAM2427 host target gene. KIAA1948 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1948 BINDING SITE, designated SEQ ID:40084, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82042] Another function of VGAM2427 is therefore inhibition of KIAA1948 (Accession XM_091984). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1948. KIAA1950 (Accession XM_166532) is another VGAM2427 host target gene. KIAA1950 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:44491, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82043] Another function of VGAM2427 is therefore inhibition of KIAA1950 (Accession XM_166532). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. KIAA1979 (Accession XM_113984) is another VGAM2427 host target gene. KIAA1979 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1979 BINDING SITE, designated SEQ ID:42592, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82044] Another function of VGAM2427 is therefore inhibition of KIAA1979 (Accession XM_113984). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1979. NYD-SP15 (Accession NM_030911) is another

VGAM2427 host target gene. NYD-SP15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NYD-SP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP15 BINDING SITE, designated SEQ ID:25178, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82045] Another function of VGAM2427 is therefore inhibition of NYD-SP15 (Accession NM_030911). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP15. Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792) is another VGAM2427 host target gene. PTPNS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPNS1 BINDING SITE, designated SEQ ID:28059, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM

RNA, also designated SEQ ID:5138.

[82046] Another function of VGAM2427 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPNS1. SMAP-5 (Accession NM_030799) is another VGAM2427 host target gene. SMAP-5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMAP-5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMAP-5 BINDING SITE, designated SEQ ID:25100, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82047] Another function of VGAM2427 is therefore inhibition of SMAP-5 (Accession NM_030799). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAP-5. LOC112609 (Accession XM_053013) is another VGAM2427 host target gene. LOC112609 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC112609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112609 BINDING SITE, designated SEQ ID:36059, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82048] Another function of VGAM2427 is therefore inhibition of LOC112609 (Accession XM_053013). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112609. LOC219540 (Accession XM_168047) is another VGAM2427 host target gene. LOC219540 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219540 BINDING SITE, designated SEQ ID:44960, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82049] Another function of VGAM2427 is therefore inhibition of LOC219540 (Accession XM_168047). Accordingly, utilities

of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219540. LOC254485 (Accession XM_170782) is another VGAM2427 host target gene. LOC254485 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254485 BINDING SITE, designated SEQ ID:45550, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82050] Another function of VGAM2427 is therefore inhibition of LOC254485 (Accession XM_170782). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254485. LOC256940 (Accession XM_172879) is another VGAM2427 host target gene. LOC256940 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256940 BINDING SITE, designated SEQ ID:46156, to the nucleotide sequence of VGAM2427 RNA, herein designated VGAM RNA, also designated SEQ ID:5138.

[82051] Another function of VGAM2427 is therefore inhibition of LOC256940 (Accession XM_172879). Accordingly, utilities of VGAM2427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256940. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2428 (VGAM2428) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82052] VGAM2428 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2428 was detected is described hereinabove with reference to Figs. 1-8.

[82053] VGAM2428 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2428 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82054] VGAM2428 gene encodes a VGAM2428 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2428 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2428 precursor RNA is designated SEQ ID:2414, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2414 is located at position 91853 relative to the genome of Goatpox Virus.

[82055] VGAM2428 precursor RNA folds onto itself, forming VGAM2428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82056] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2428 folded precursor RNA into VGAM2428 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM2428 RNA is designated SEQ ID:5139, and is provided hereinbelow with reference to the sequence listing part.

[82057] VGAM2428 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2428 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2428 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82058] VGAM2428 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2428 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2428 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2428 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2428 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82059] The complementary binding of VGAM2428 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2428 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2428 host target RNA into VGAM2428 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82060] It is appreciated that VGAM2428 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2428 host target genes. The mRNA of each one of this plurality of VGAM2428 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2428 RNA, herein designated VGAM RNA, and which when bound by VGAM2428 RNA causes inhibition of translation of respective one or more VGAM2428 host target proteins.

[82061] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2428 gene, herein designated VGAM GENE, on one or more VGAM2428 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82062] It is yet further appreciated that a function of VGAM2428 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2428 correlate with, and may be deduced from, the identity of the host target genes which VGAM2428 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82063] Nucleotide sequences of the VGAM2428 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2428 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2428 are further described hereinbelow with reference to Table 1.

[82064] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2428 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2428 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82065] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2428 gene, herein designated VGAM is inhibition of expression of VGAM2428 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2428 correlate with, and may be deduced from, the identity of the target genes which VGAM2428 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82066] Adenosine Deaminase, RNA-specific (ADAR, Accession NM_001111) is a VGAM2428 host target gene. ADAR BINDING SITE1 through ADAR BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAR BINDING SITE1 through ADAR BINDING SITE3, designated SEQ ID:6774, SEQ ID:17967 and SEQ ID:17960 respectively, to the nucleotide sequence of VGAM2428 RNA, herein designated

VGAM RNA, also designated SEQ ID:5139.

[82067] A function of VGAM2428 is therefore inhibition of Adenosine Deaminase, RNA-specific (ADAR, Accession NM_001111), a gene which converts adenosine to inosine in double-stranded RNA. Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAR. The function of ADAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.Matrix Metalloproteinase 19 (MMP19, Accession NM_022792) is another VGAM2428 host target gene. MMP19 BINDING SITE1 through MMP19 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MMP19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP19 BINDING SITE1 through MMP19 BINDING SITE4, designated SEQ ID:23082, SEQ ID:23077, SEQ ID:23079 and SEQ ID:8269 respectively, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82068] Another function of VGAM2428 is therefore inhibition of Matrix Metalloproteinase 19 (MMP19, Accession NM_022792). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP19. FLJ12704 (Accession NM_024998) is another VGAM2428 host target gene. FLJ12704 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12704 BINDING SITE, designated SEQ ID:24565, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82069] Another function of VGAM2428 is therefore inhibition of FLJ12704 (Accession NM_024998). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12704. H326 (Accession NM_015726) is another VGAM2428 host target gene. H326 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H326, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H326 BINDING SITE, designated SEQ ID:17938, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82070] Another function of VGAM2428 is therefore inhibition of H326 (Accession NM_015726). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H326. KIAA0594 (Accession XM_036117) is another VGAM2428 host target gene. KIAA0594 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0594 BINDING SITE, designated SEQ ID:32387, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82071] Another function of VGAM2428 is therefore inhibition of KIAA0594 (Accession XM_036117). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0594. KIAA1634 (Accession XM_032749) is another VGAM2428 host target gene. KIAA1634 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:31750, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82072] Another function of VGAM2428 is therefore inhibition of KIAA1634 (Accession XM_032749). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. KIAA1831 (Accession XM_033366) is another VGAM2428 host target gene. KIAA1831 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1831 BINDING SITE, designated SEQ ID:31905, to the

nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82073] Another function of VGAM2428 is therefore inhibition of KIAA1831 (Accession XM_033366). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1831. Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM_005446) is another VGAM2428 host target gene. P2RXL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P2RXL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RXL1 BINDING SITE, designated SEQ ID:11932, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82074] Another function of VGAM2428 is therefore inhibition of Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM_005446). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RXL1. PRP8 Pre-mRNA Processing Factor 8 Homolog

(yeast) (PRPF8, Accession XM_028335) is another VGAM2428 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30680, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82075] Another function of VGAM2428 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8. LOC120534 (Accession XM_058476) is another VGAM2428 host target gene. LOC120534 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120534 BINDING SITE, designated SEQ ID:36626, to

the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82076] Another function of VGAM2428 is therefore inhibition of LOC120534 (Accession XM_058476). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120534. LOC131870 (Accession XM_059544) is another VGAM2428 host target gene. LOC131870 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC131870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131870 BINDING SITE, designated SEQ ID:37016, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82077] Another function of VGAM2428 is therefore inhibition of LOC131870 (Accession XM_059544). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131870. LOC144866 (Accession XM_096699) is another VGAM2428 host target gene. LOC144866 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC144866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144866 BINDING SITE, designated SEQ ID:40476, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82078] Another function of VGAM2428 is therefore inhibition of LOC144866 (Accession XM_096699). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144866. LOC146774 (Accession XM_085584) is another VGAM2428 host target gene. LOC146774 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146774, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146774 BINDING SITE, designated SEQ ID:38234, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82079] Another function of VGAM2428 is therefore inhibition of LOC146774 (Accession XM_085584). Accordingly, utilities

of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146774. LOC150848 (Accession XM_097959) is another VGAM2428 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:41254, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82080] Another function of VGAM2428 is therefore inhibition of LOC150848 (Accession XM_097959). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150848. LOC151610 (Accession XM_087245) is another VGAM2428 host target gene. LOC151610 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC151610 BINDING SITE, designated SEQ ID:39134, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82081] Another function of VGAM2428 is therefore inhibition of LOC151610 (Accession XM_087245). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151610. LOC152317 (Accession XM_098189) is another VGAM2428 host target gene. LOC152317 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152317 BINDING SITE, designated SEQ ID:41467, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82082] Another function of VGAM2428 is therefore inhibition of LOC152317 (Accession XM_098189). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152317. LOC203378 (Accession XM_117541) is another VGAM2428 host target gene. LOC203378 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43558, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82083] Another function of VGAM2428 is therefore inhibition of LOC203378 (Accession XM_117541). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC219347 (Accession XM_167564) is another VGAM2428 host target gene. LOC219347 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219347 BINDING SITE, designated SEQ ID:44678, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82084] Another function of VGAM2428 is therefore inhibition of

LOC219347 (Accession XM_167564). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219347. LOC91561 (Accession XM_039218) is another VGAM2428 host target gene. LOC91561 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91561, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91561 BINDING SITE, designated SEQ ID:33021, to the nucleotide sequence of VGAM2428 RNA, herein designated VGAM RNA, also designated SEQ ID:5139.

[82085] Another function of VGAM2428 is therefore inhibition of LOC91561 (Accession XM_039218). Accordingly, utilities of VGAM2428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91561. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2429 (VGAM2429) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[82086] VGAM2429 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2429 was detected is described hereinabove with reference to Figs. 1-8.

[82087] VGAM2429 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2429 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82088] VGAM2429 gene encodes a VGAM2429 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2429 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2429 precursor RNA is designated SEQ ID:2415, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2415 is located at position 58421 relative to the genome of Goatpox Virus.

[82089] VGAM2429 precursor RNA folds onto itself, forming VGAM2429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82090] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2429 folded precursor RNA into VGAM2429 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2429 RNA is designated SEQ ID:5140, and is provided hereinbelow with reference to the sequence listing part.

[82091] VGAM2429 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2429 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2429 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82092] VGAM2429 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2429 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2429 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2429 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2429 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[82093] The complementary binding of VGAM2429 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2429 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2429 host target RNA into VGAM2429 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82094] It is appreciated that VGAM2429 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2429 host target genes. The mRNA of each one of this plurality of VGAM2429 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2429 RNA, herein designated VGAM RNA, and which when bound by VGAM2429 RNA causes inhibition of translation of respective one or more VGAM2429 host target proteins.

[82095] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2429 gene, herein designated VGAM GENE, on one

or more VGAM2429 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82096] It is yet further appreciated that a function of VGAM2429 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2429 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2429 correlate with, and may be deduced from, the identity of the host target genes which VGAM2429 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82097] Nucleotide sequences of the VGAM2429 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2429 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2429 are further described hereinbelow with reference to Table 1.

[82098] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2429 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2429 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82099] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2429 gene, herein designated VGAM is inhibition of expression of VGAM2429 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2429 correlate with, and may be deduced from, the identity of the target genes which VGAM2429 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82100] Apical Protein-like (Xenopus laevis) (APXL, Accession

NM_001649) is a VGAM2429 host target gene. APXL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APXL BINDING SITE, designated SEQ ID:7356, to the nucleotide sequence of VGAM2429 RNA, herein designated VGAM RNA, also designated SEQ ID:5140.

[82101] A function of VGAM2429 is therefore inhibition of Apical Protein-like (Xenopus laevis) (APXL, Accession NM_001649), a gene which is implicated in amiloride-sensitive sodium channel activity. Accordingly, utilities of VGAM2429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APXL. The function of APXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.Eukaryotic Translation Initiation Factor 2, Subunit 3 Gamma, 52kDa (EIF2S3, Accession NM_001415) is another VGAM2429 host target gene. EIF2S3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF2S3, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2S3 BINDING SITE, designated SEQ ID:7110, to the nucleotide sequence of VGAM2429 RNA, herein designated VGAM RNA, also designated SEQ ID:5140.

[82102] Another function of VGAM2429 is therefore inhibition of Eukaryotic Translation Initiation Factor 2, Subunit 3 Gamma, 52kDa (EIF2S3, Accession NM_001415), a gene which functions in the early steps of protein synthesis. Accordingly, utilities of VGAM2429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2S3. The function of EIF2S3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1254.Lumican (LUM, Accession NM_002345) is another VGAM2429 host target gene. LUM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LUM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LUM BINDING SITE, designated SEQ ID:8145,

to the nucleotide sequence of VGAM2429 RNA, herein designated VGAM RNA, also designated SEQ ID:5140.

[82103] Another function of VGAM2429 is therefore inhibition of Lumican (LUM, Accession NM_002345). Accordingly, utilities of VGAM2429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LUM. ERp44 (Accession XM_088476) is another VGAM2429 host target gene. ERp44 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ERp44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERp44 BINDING SITE, designated SEQ ID:39726, to the nucleotide sequence of VGAM2429 RNA, herein designated VGAM RNA, also designated SEQ ID:5140.

[82104] Another function of VGAM2429 is therefore inhibition of ERp44 (Accession XM_088476). Accordingly, utilities of VGAM2429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERp44. PNPASE (Accession XM_048088) is another VGAM2429 host target gene. PNPASE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by PNPASE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNPASE BINDING SITE, designated SEQ ID:35102, to the nucleotide sequence of VGAM2429 RNA, herein designated VGAM RNA, also designated SEQ ID:5140.

[82105] Another function of VGAM2429 is therefore inhibition of PNPASE (Accession XM_048088). Accordingly, utilities of VGAM2429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNPASE. LOC115648 (Accession NM_145326) is another VGAM2429 host target gene. LOC115648 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115648, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115648 BINDING SITE, designated SEQ ID:29829, to the nucleotide sequence of VGAM2429 RNA, herein designated VGAM RNA, also designated SEQ ID:5140.

[82106] Another function of VGAM2429 is therefore inhibition of LOC115648 (Accession NM_145326). Accordingly, utilities

of VGAM2429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115648. LOC255308 (Accession XM_170536) is another VGAM2429 host target gene. LOC255308 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255308 BINDING SITE, designated SEQ ID:45353, to the nucleotide sequence of VGAM2429 RNA, herein designated VGAM RNA, also designated SEQ ID:5140.

[82107] Another function of VGAM2429 is therefore inhibition of LOC255308 (Accession XM_170536). Accordingly, utilities of VGAM2429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255308. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2430 (VGAM2430) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82108] VGAM2430 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2430 was detected is described hereinabove with reference to Figs. 1-8.

[82109] VGAM2430 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2430 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82110] VGAM2430 gene encodes a VGAM2430 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2430 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2430 precursor RNA is designated SEQ ID:2416, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2416 is located at position 123911 relative to the genome of Goatpox Virus.

[82111] VGAM2430 precursor RNA folds onto itself, forming VGAM2430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82112] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2430 folded precursor RNA into VGAM2430 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2430 RNA is designated SEQ ID:5141, and is provided hereinbelow with reference to the sequence listing part.

[82113] VGAM2430 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2430 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2430 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[82114] VGAM2430 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2430 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2430 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2430 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2430 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82115] The complementary binding of VGAM2430 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2430 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2430 host target RNA into VGAM2430 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82116] It is appreciated that VGAM2430 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2430 host target genes. The mRNA of each one of this plurality of VGAM2430 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2430 RNA, herein designated VGAM RNA, and which when bound by VGAM2430 RNA causes inhibition of translation of respective one or more VGAM2430 host target proteins.

[82117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2430 gene, herein designated VGAM GENE, on one or more VGAM2430 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82118] It is yet further appreciated that a function of VGAM2430 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2430 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2430 correlate with, and may be deduced from, the identity of the host target genes which VGAM2430 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82119] Nucleotide sequences of the VGAM2430 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2430 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2430 are further described hereinbelow with reference to Table 1.

[82120] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2430 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2430 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82121] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2430 gene, herein designated VGAM is inhibition of expression of VGAM2430 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2430 correlate with, and may be deduced from, the identity of the target genes which VGAM2430 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82122] Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM_006493) is a VGAM2430 host target gene. CLN5

BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN5 BINDING SITE, designated SEQ ID:13230, to the nucleotide sequence of VGAM2430 RNA, herein designated VGAM RNA, also designated SEQ ID:5141.

[82123] A function of VGAM2430 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM_006493). Accordingly, utilities of VGAM2430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN5. DKFZP434I0714 (Accession XM_098247) is another VGAM2430 host target gene. DKFZP434I0714 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434I0714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I0714 BINDING SITE, designated SEQ ID:41529, to the nucleotide sequence of VGAM2430 RNA, herein designated VGAM RNA, also designated SEQ ID:5141.

[82124] Another function of VGAM2430 is therefore inhibition of DKFZP434I0714 (Accession XM_098247). Accordingly, utilities of VGAM2430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I0714. DKFZP564F013 (Accession XM_168479) is another VGAM2430 host target gene. DKFZP564F013 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564F013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564F013 BINDING SITE, designated SEQ ID:45200, to the nucleotide sequence of VGAM2430 RNA, herein designated VGAM RNA, also designated SEQ ID:5141.

[82125] Another function of VGAM2430 is therefore inhibition of DKFZP564F013 (Accession XM_168479). Accordingly, utilities of VGAM2430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564F013. KIAA1674 (Accession XM_044065) is another VGAM2430 host target gene. KIAA1674 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1674, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1674 BINDING SITE, designated SEQ ID:34111, to the nucleotide sequence of VGAM2430 RNA, herein designated VGAM RNA, also designated SEQ ID:5141.

[82126] Another function of VGAM2430 is therefore inhibition of KIAA1674 (Accession XM_044065). Accordingly, utilities of VGAM2430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1674. LOC145773 (Accession XM_085237) is another VGAM2430 host target gene. LOC145773 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145773 BINDING SITE, designated SEQ ID:37984, to the nucleotide sequence of VGAM2430 RNA, herein designated VGAM RNA, also designated SEQ ID:5141.

[82127] Another function of VGAM2430 is therefore inhibition of LOC145773 (Accession XM_085237). Accordingly, utilities of VGAM2430 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145773. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2431 (VGAM2431) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82128] VGAM2431 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2431 was detected is described hereinabove with reference to Figs. 1-8.

[82129] VGAM2431 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2431 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82130] VGAM2431 gene encodes a VGAM2431 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2431 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2431 precursor RNA is desig-

nated SEQ ID:2417, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2417 is located at position 113097 relative to the genome of Goatpox Virus.

[82131] VGAM2431 precursor RNA folds onto itself, forming VGAM2431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82132] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2431 folded precursor RNA into VGAM2431 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2431 RNA is designated SEQ ID:5142, and is provided hereinbelow with reference to the sequence

listing part.

[82133] VGAM2431 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2431 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2431 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82134] VGAM2431 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2431 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2431 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2431 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2431 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82135] The complementary binding of VGAM2431 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2431 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2431 host target RNA into VGAM2431 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82136] It is appreciated that VGAM2431 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2431 host target genes. The mRNA of each one of this plurality of VGAM2431 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2431 RNA, herein designated VGAM

RNA, and which when bound by VGAM2431 RNA causes inhibition of translation of respective one or more VGAM2431 host target proteins.

[82137] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2431 gene, herein designated VGAM GENE, on one or more VGAM2431 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82138] It is yet further appreciated that a function of VGAM2431 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2431 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2431 correlate with, and may be deduced from, the identity of the host target genes which VGAM2431 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82139] Nucleotide sequences of the VGAM2431 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2431 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2431 are further described hereinbelow with reference to Table 1.

[82140] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2431 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2431 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82141] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2431 gene, herein designated VGAM is

inhibition of expression of VGAM2431 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2431 correlate with, and may be deduced from, the identity of the target genes which VGAM2431 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82142] Cyclin F (CCNF, Accession NM_001761) is a VGAM2431 host target gene. CCNF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCNF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNF BINDING SITE, designated SEQ ID:7524, to the nucleotide sequence of VGAM2431 RNA, herein designated VGAM RNA, also designated SEQ ID:5142.

[82143] A function of VGAM2431 is therefore inhibition of Cyclin F (CCNF, Accession NM_001761), a gene which likely to be involved in the control of the cell cycle during s phase and g2. Accordingly, utilities of VGAM2431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNF. The function of CCNF and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM367.Mitogen-activated Protein Kinase Kinase Kinase 1 (MAP3K1, Accession XM_042066) is another VGAM2431 host target gene. MAP3K1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K1 BINDING SITE, designated SEQ ID:33681, to the nucleotide sequence of VGAM2431 RNA, herein designated VGAM RNA, also designated SEQ ID:5142.

[82144] Another function of VGAM2431 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 1 (MAP3K1, Accession XM_042066), a gene which can phosphorylate and activate mapkk 1 and mapkk 2 (mek1/mek2) which leads to phosphorylation of map kinases. it is also a highly efficient activator of the jnk cascade. Accordingly, utilities of VGAM2431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K1. The function of MAP3K1 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM469.C6.1A (Accession NM_024332) is another VGAM2431 host target gene. C6.1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C6.1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6.1A BINDING SITE, designated SEQ ID:23639, to the nucleotide sequence of VGAM2431 RNA, herein designated VGAM RNA, also designated SEQ ID:5142.

[82145] Another function of VGAM2431 is therefore inhibition of C6.1A (Accession NM_024332). Accordingly, utilities of VGAM2431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6.1A. KIAA1715 (Accession XM_042834) is another VGAM2431 host target gene. KIAA1715 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1715 BINDING SITE,

designated SEQ ID:33791, to the nucleotide sequence of VGAM2431 RNA, herein designated VGAM RNA, also designated SEQ ID:5142.

[82146] Another function of VGAM2431 is therefore inhibition of KIAA1715 (Accession XM_042834). Accordingly, utilities of VGAM2431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1715. LOC146839 (Accession XM_097107) is another VGAM2431 host target gene. LOC146839 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146839 BINDING SITE, designated SEQ ID:40752, to the nucleotide sequence of VGAM2431 RNA, herein designated VGAM RNA, also designated SEQ ID:5142.

[82147] Another function of VGAM2431 is therefore inhibition of LOC146839 (Accession XM_097107). Accordingly, utilities of VGAM2431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146839. LOC200609 (Accession XM_117256) is another VGAM2431 host target gene. LOC200609 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43324, to the nucleotide sequence of VGAM2431 RNA, herein designated VGAM RNA, also designated SEQ ID:5142.

[82148] Another function of VGAM2431 is therefore inhibition of LOC200609 (Accession XM_117256). Accordingly, utilities of VGAM2431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2432 (VGAM2432) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82149] VGAM2432 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2432 was detected is described hereinabove with reference to Figs. 1-8.

[82150] VGAM2432 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2432 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82151] VGAM2432 gene encodes a VGAM2432 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2432 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2432 precursor RNA is designated SEQ ID:2418, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2418 is located at position 76475 relative to the genome of Goatpox Virus.

[82152] VGAM2432 precursor RNA folds onto itself, forming VGAM2432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[82153] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2432 folded precursor RNA into VGAM2432 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM2432 RNA is designated SEQ ID:5143, and is provided hereinbelow with reference to the sequence listing part.

[82154] VGAM2432 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2432 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2432 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82155] VGAM2432 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2432 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2432 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2432 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2432 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82156] The complementary binding of VGAM2432 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2432 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2432 host target RNA into VGAM2432 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82157] It is appreciated that VGAM2432 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2432 host target genes. The mRNA of each one of this plurality of VGAM2432 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2432 RNA, herein designated VGAM RNA, and which when bound by VGAM2432 RNA causes inhibition of translation of respective one or more VGAM2432 host target proteins.

[82158] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2432 gene, herein designated VGAM GENE, on one or more VGAM2432 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82159] It is yet further appreciated that a function of VGAM2432 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2432 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2432 correlate with, and may be deduced from, the identity of the host target genes which VGAM2432 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82160] Nucleotide sequences of the VGAM2432 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2432 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2432 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2432 are further described hereinbelow with reference to Table 1.

[82161] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2432 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2432 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82162] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2432 gene, herein designated VGAM is inhibition of expression of VGAM2432 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2432 correlate with, and may be deduced from, the identity of the target genes which VGAM2432 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82163] Crystallin, Zeta (quinone reductase) (CRYZ, Accession NM_001889) is a VGAM2432 host target gene. CRYZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRYZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of CRYZ BINDING SITE, designated SEQ ID:7616, to the nucleotide sequence of VGAM2432 RNA, herein designated VGAM RNA, also designated SEQ ID:5143.

[82164] A function of VGAM2432 is therefore inhibition of Crystallin, Zeta (quinone reductase) (CRYZ, Accession NM_001889), a gene which may act in the detoxification of xenobiotics. Accordingly, utilities of VGAM2432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRYZ. The function of CRYZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.EphA3 (EPHA3, Accession NM_005233) is another VGAM2432 host target gene. EPHA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA3 BINDING SITE, designated SEQ ID:11738, to the nucleotide sequence of VGAM2432 RNA, herein designated VGAM RNA, also designated SEQ ID:5143.

[82165] Another function of VGAM2432 is therefore inhibition of EphA3 (EPHA3, Accession NM_005233), a gene which binds to ephrin-a2, -a3, -a4 and -a5. could play a role in lymphoid function. Accordingly, utilities of VGAM2432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA3. The function of EPHA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM164.FLJ20686 (Accession NM_017925) is another VGAM2432 host target gene. FLJ20686 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20686 BINDING SITE, designated SEQ ID:19595, to the nucleotide sequence of VGAM2432 RNA, herein designated VGAM RNA, also designated SEQ ID:5143.

[82166] Another function of VGAM2432 is therefore inhibition of FLJ20686 (Accession NM_017925). Accordingly, utilities of VGAM2432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20686. KIAA0089 (Accession XM_046056) is another VGAM2432 host target gene. KIAA0089 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0089 BINDING SITE, designated SEQ ID:34669, to the nucleotide sequence of VGAM2432 RNA, herein designated VGAM RNA, also designated SEQ ID:5143.

[82167] Another function of VGAM2432 is therefore inhibition of KIAA0089 (Accession XM_046056). Accordingly, utilities of VGAM2432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0089. KIAA0429 (Accession NM_014751) is another VGAM2432 host target gene. KIAA0429 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0429 BINDING SITE, designated SEQ ID:16465, to the nucleotide sequence of VGAM2432 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5143.

[82168] Another function of VGAM2432 is therefore inhibition of KIAA0429 (Accession NM_014751). Accordingly, utilities of VGAM2432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0429. SEC15L (Accession XM_051147) is another VGAM2432 host target gene. SEC15L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC15L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC15L BINDING SITE, designated SEQ ID:35764, to the nucleotide sequence of VGAM2432 RNA, herein designated VGAM RNA, also designated SEQ ID:5143.

[82169] Another function of VGAM2432 is therefore inhibition of SEC15L (Accession XM_051147). Accordingly, utilities of VGAM2432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC15L. LOC147341 (Accession XM_097223) is another VGAM2432 host target gene. LOC147341 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147341, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147341 BINDING SITE, designated SEQ ID:40825, to the nucleotide sequence of VGAM2432 RNA, herein designated VGAM RNA, also designated SEQ ID:5143.

[82170] Another function of VGAM2432 is therefore inhibition of LOC147341 (Accession XM_097223). Accordingly, utilities of VGAM2432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147341. LOC256277 (Accession XM_170644) is another VGAM2432 host target gene. LOC256277 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256277 BINDING SITE, designated SEQ ID:45425, to the nucleotide sequence of VGAM2432 RNA, herein designated VGAM RNA, also designated SEQ ID:5143.

[82171] Another function of VGAM2432 is therefore inhibition of LOC256277 (Accession XM_170644). Accordingly, utilities of VGAM2432 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC256277. LOC86651 (Accession XM_044052) is another VGAM2432 host target gene. LOC86651 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC86651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC86651 BINDING SITE, designated SEQ ID:34097, to the nucleotide sequence of VGAM2432 RNA, herein designated VGAM RNA, also designated SEQ ID:5143.

[82172] Another function of VGAM2432 is therefore inhibition of LOC86651 (Accession XM_044052). Accordingly, utilities of VGAM2432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC86651. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2433 (VGAM2433) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82173] VGAM2433 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2433 was detected is described hereinabove with reference to Figs. 1-8.

[82174] VGAM2433 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2433 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82175] VGAM2433 gene encodes a VGAM2433 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2433 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2433 precursor RNA is designated SEQ ID:2419, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2419 is located at position 30434 relative to the genome of Goatpox Virus.

[82176] VGAM2433 precursor RNA folds onto itself, forming VGAM2433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82177] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2433 folded precursor RNA into VGAM2433 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM2433 RNA is designated SEQ ID:5144, and is provided hereinbelow with reference to the sequence listing part.

[82178] VGAM2433 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2433 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2433 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82179] VGAM2433 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2433 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2433 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2433 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2433 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82180] The complementary binding of VGAM2433 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2433 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2433 host target RNA into VGAM2433 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82181] It is appreciated that VGAM2433 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2433 host target genes. The mRNA of each one of this plurality of VGAM2433 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2433 RNA, herein designated VGAM RNA, and which when bound by VGAM2433 RNA causes inhibition of translation of respective one or more VGAM2433 host target proteins.

[82182] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2433 gene, herein designated VGAM GENE, on one or more VGAM2433 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82183] It is yet further appreciated that a function of VGAM2433 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2433 correlate with, and may be deduced from, the identity of the host target genes which VGAM2433 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82184] Nucleotide sequences of the VGAM2433 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2433 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2433 are further described hereinbelow with reference to Table 1.

[82185] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2433 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2433 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82186] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2433 gene, herein designated VGAM is inhibition of expression of VGAM2433 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2433 correlate with, and may be deduced from, the identity of the target genes which VGAM2433 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82187] B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898) is a VGAM2433 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23164, to the nucleotide sequence of VGAM2433 RNA, herein designated VGAM RNA, also designated SEQ ID:5144.

[82188] A function of VGAM2433 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898). Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM_000492) is another VGAM2433 host target gene. CFTR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CFTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CFTR BINDING SITE, designated SEQ ID:6104, to the nucleotide sequence of VGAM2433 RNA, herein

designated VGAM RNA, also designated SEQ ID:5144.

[82189] Another function of VGAM2433 is therefore inhibition of Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM_000492). Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CFTR. COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_078470) is another VGAM2433 host target gene. COX15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:27790, to the nucleotide sequence of VGAM2433 RNA, herein designated VGAM RNA, also designated SEQ ID:5144.

[82190] Another function of VGAM2433 is therefore inhibition of COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_078470). Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with COX15. Replication Protein A3, 14kDa (RPA3, Accession NM_002947) is another VGAM2433 host target gene. RPA3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RPA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPA3 BINDING SITE, designated SEQ ID:8858, to the nucleotide sequence of VGAM2433 RNA, herein designated VGAM RNA, also designated SEQ ID:5144.

[82191] Another function of VGAM2433 is therefore inhibition of Replication Protein A3, 14kDa (RPA3, Accession NM_002947). Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPA3. Sodium Channel, Voltage-gated, Type III, Alpha Polypeptide (SCN3A, Accession NM_006922) is another VGAM2433 host target gene. SCN3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN3A BINDING SITE, designated SEQ

ID:13798, to the nucleotide sequence of VGAM2433 RNA, herein designated VGAM RNA, also designated SEQ ID:5144.

[82192] Another function of VGAM2433 is therefore inhibition of Sodium Channel, Voltage-gated, Type III, Alpha Polypeptide (SCN3A, Accession NM_006922), a gene which may be important for maintaining neural membrane excitability. Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN3A. The function of SCN3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM124.FLJ23151 (Accession NM_024772) is another VGAM2433 host target gene. FLJ23151 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23151, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23151 BINDING SITE, designated SEQ ID:24135, to the nucleotide sequence of VGAM2433 RNA, herein designated VGAM RNA, also designated SEQ ID:5144.

[82193] Another function of VGAM2433 is therefore inhibition of FLJ23151 (Accession NM_024772). Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23151. KIAA1468 (Accession XM_166289) is another VGAM2433 host target gene. KIAA1468 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1468 BINDING SITE, designated SEQ ID:44102, to the nucleotide sequence of VGAM2433 RNA, herein designated VGAM RNA, also designated SEQ ID:5144.

[82194] Another function of VGAM2433 is therefore inhibition of KIAA1468 (Accession XM_166289). Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1468. LRP15 (Accession NM_052953) is another VGAM2433 host target gene. LRP15 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LRP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP15 BINDING SITE, designated SEQ ID:27510, to the nucleotide sequence of VGAM2433 RNA, herein designated VGAM RNA, also designated SEQ ID:5144.

[82195] Another function of VGAM2433 is therefore inhibition of LRP15 (Accession NM_052953). Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP15. LOC121536 (Accession XM_058567) is another VGAM2433 host target gene. LOC121536 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC121536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121536 BINDING SITE, designated SEQ ID:36666, to the nucleotide sequence of VGAM2433 RNA, herein designated VGAM RNA, also designated SEQ ID:5144.

[82196] Another function of VGAM2433 is therefore inhibition of LOC121536 (Accession XM_058567). Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC121536. LOC254251 (Accession XM_171088) is another VGAM2433 host target gene. LOC254251 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254251 BINDING SITE, designated SEQ ID:45895, to the nucleotide sequence of VGAM2433 RNA, herein designated VGAM RNA, also designated SEQ ID:5144.

[82197] Another function of VGAM2433 is therefore inhibition of LOC254251 (Accession XM_171088). Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254251. LOC51301 (Accession NM_016591) is another VGAM2433 host target gene. LOC51301 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51301 BINDING SITE, designated SEQ ID:18674, to the nucleotide sequence of VGAM2433 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5144.

[82198] Another function of VGAM2433 is therefore inhibition of LOC51301 (Accession NM_016591). Accordingly, utilities of VGAM2433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2434 (VGAM2434) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82199] VGAM2434 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2434 was detected is described hereinabove with reference to Figs. 1-8.

[82200] VGAM2434 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2434 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82201] VGAM2434 gene encodes a VGAM2434 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2434 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2434 precursor RNA is designated SEQ ID:2420, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2420 is located at position 130867 relative to the genome of Goatpox Virus.

[82202] VGAM2434 precursor RNA folds onto itself, forming VGAM2434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82203] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2434 folded precursor RNA into VGAM2434 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2434 RNA is designated SEQ ID:5145, and is provided hereinbelow with reference to the sequence listing part.

[82204] VGAM2434 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2434 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2434 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82205] VGAM2434 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2434 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2434 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2434 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2434 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82206] The complementary binding of VGAM2434 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2434 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2434 host target RNA into VGAM2434 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82207] It is appreciated that VGAM2434 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2434 host target genes. The mRNA of

each one of this plurality of VGAM2434 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2434 RNA, herein designated VGAM RNA, and which when bound by VGAM2434 RNA causes inhibition of translation of respective one or more VGAM2434 host target proteins.

[82208] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2434 gene, herein designated VGAM GENE, on one or more VGAM2434 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[82209] It is yet further appreciated that a function of VGAM2434 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2434 correlate with, and may be deduced from, the identity of the host target genes which VGAM2434 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82210] Nucleotide sequences of the VGAM2434 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2434 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2434 are further described hereinbelow with reference to Table 1.

[82211] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2434 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2434 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82212] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2434 gene, herein designated VGAM is inhibition of expression of VGAM2434 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2434 correlate with, and may be deduced from, the identity of the target genes which VGAM2434 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82213] Alpha-1-B Glycoprotein (A1BG, Accession NM_130786) is a VGAM2434 host target gene. A1BG BINDING SITE1 and A1BG BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by A1BG, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A1BG BINDING SITE1 and A1BG BINDING SITE2, designated SEQ ID:28279 and SEQ ID:28280 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82214] A function of VGAM2434 is therefore inhibition of Alpha-1-B Glycoprotein (A1BG, Accession NM_130786), a gene

which a plasma protein of unknown function. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A1BG. The function of A1BG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.Apoptotic Protease Activating Factor (APAF1, Accession NM_001160) is another VGAM2434 host target gene. APAF1 BINDING SITE1 through APAF1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by APAF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APAF1 BINDING SITE1 through APAF1 BINDING SITE4, designated SEQ ID:6830, SEQ ID:6831, SEQ ID:14869 and SEQ ID:14870 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82215] Another function of VGAM2434 is therefore inhibition of Apoptotic Protease Activating Factor (APAF1, Accession NM_001160), a gene which functions in the mitochondrial apoptotic pathway that leads to caspase 9 dependent acti-

vation of caspase 3. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APAF1. The function of APAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552.Aquaporin 6, Kidney Specific (AQP6, Accession NM_001652) is another VGAM2434 host target gene. AQP6 BINDING SITE1 and AQP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AQP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE1 and AQP6 BINDING SITE2, designated SEQ ID:7361 and SEQ ID:27619 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82216] Another function of VGAM2434 is therefore inhibition of Aquaporin 6, Kidney Specific (AQP6, Accession NM_001652), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid-base metabolism. Accordingly, utilities

of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6. The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340.ATPase, Na+/K+ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678) is another VGAM2434 host target gene. ATP1B2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE, designated SEQ ID:7393, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82217] Another function of VGAM2434 is therefore inhibition of ATPase, Na+/K+ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na +/K+ ions across the plasma membrane. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with ATP1B2. The function of ATP1B2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933) is another VGAM2434 host target gene. ATP8B2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP8B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:32517, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82218] Another function of VGAM2434 is therefore inhibition of ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. BRIP1 (Accession NM_032043) is another VGAM2434 host target gene. BRIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BRIP1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRIP1 BINDING SITE, designated SEQ ID:25757, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82219] Another function of VGAM2434 is therefore inhibition of BRIP1 (Accession NM_032043). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRIP1. Chromosome 20 Open Reading Frame 1 (C20orf1, Accession NM_012112) is another VGAM2434 host target gene. C20orf1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf1 BINDING SITE, designated SEQ ID:14428, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82220] Another function of VGAM2434 is therefore inhibition of Chromosome 20 Open Reading Frame 1 (C20orf1, Accession NM_012112), a gene which is a nuclear proliferation-

associated protein. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf1. The function of C20orf1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.Cold Autoinflammatory Syndrome 1 (CIAS1, Accession NM_004895) is another VGAM2434 host target gene. CIAS1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CIAS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIAS1 BINDING SITE, designated SEQ ID:11322, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82221] Another function of VGAM2434 is therefore inhibition of Cold Autoinflammatory Syndrome 1 (CIAS1, Accession NM_004895), a gene which may mediate protein-protein interactions; contains a leucine rich repeat. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIAS1. The function of CIAS1 and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM316.COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_078470) is another VGAM2434 host target gene. COX15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:27789, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82222] Another function of VGAM2434 is therefore inhibition of COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_078470). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX15. Cartilage Associated Protein (CRTAP, Accession NM_006371) is another VGAM2434 host target gene. CRTAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRTAP,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRTAP BINDING SITE, designated SEQ ID:13063, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82223] Another function of VGAM2434 is therefore inhibition of Cartilage Associated Protein (CRTAP, Accession NM_006371), a gene which is a novel developmentally regulated chick embryo protein. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAP. The function of CRTAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.Chemokine (C-X-C motif) Ligand 16 (CXCL16, Accession NM_022059) is another VGAM2434 host target gene. CXCL16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CXCL16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of CXCL16 BINDING SITE, designated SEQ ID:22598, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82224] Another function of VGAM2434 is therefore inhibition of Chemokine (C-X-C motif) Ligand 16 (CXCL16, Accession NM_022059), a gene which induces calcium mobilization. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL16. The function of CXCL16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1845.Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 2 (CYP1A2, Accession NM_000761) is another VGAM2434 host target gene. CYP1A2 BINDING SITE1 through CYP1A2 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CYP1A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP1A2 BINDING SITE1 through CYP1A2 BINDING SITE4, desig-

nated SEQ ID:6413, SEQ ID:6411, SEQ ID:34255 and SEQ ID:34257 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82225] Another function of VGAM2434 is therefore inhibition of Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 2 (CYP1A2, Accession NM_000761), a gene which intervenes in an NADPH-dependent electron transport pathway. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP1A2. The function of CYP1A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM_113366) is another VGAM2434 host target gene. DFFB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DFFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFFB BINDING SITE, designated SEQ ID:42246, to the nu-

cleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82226] Another function of VGAM2434 is therefore inhibition of DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM_113366), a gene which induces DNA fragmentation and chromatin condensation during apoptosis. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFFB. The function of DFFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662) is another VGAM2434 host target gene. DISC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DISC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DISC1 BINDING SITE, designated SEQ ID:20740, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82227] Another function of VGAM2434 is therefore inhibition of Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662), a gene which has globular N-terminal domain(s) and a helical C-terminal domain. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DISC1. The function of DISC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Down Syndrome Critical Region Gene 3 (DSCR3, Accession NM_006052) is another VGAM2434 host target gene. DSCR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DSCR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR3 BINDING SITE, designated SEQ ID:12688, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82228] Another function of VGAM2434 is therefore inhibition of Down Syndrome Critical Region Gene 3 (DSCR3, Accession NM_006052). Accordingly, utilities of VGAM2434 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR3. EPB72 (Accession NM_004099) is another VGAM2434 host target gene. EPB72 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPB72, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB72 BINDING SITE, designated SEQ ID:10307, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82229] Another function of VGAM2434 is therefore inhibition of EPB72 (Accession NM_004099), a gene which may regulate cation conductance. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB72. The function of EPB72 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1560.Ellis Van Creveld Syndrome (EVC, Accession NM_014556) is another VGAM2434 host target gene. EVC BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by EVC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVC BINDING SITE, designated SEQ ID:15895, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82230] Another function of VGAM2434 is therefore inhibition of Ellis Van Creveld Syndrome (EVC, Accession NM_014556). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC. Fasciculation and Elongation Protein Zeta 1 (zygin I) (FEZ1, Accession NM_022549) is another VGAM2434 host target gene. FEZ1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FEZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEZ1 BINDING SITE, designated SEQ ID:22879, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82231] Another function of VGAM2434 is therefore inhibition of

Fasciculation and Elongation Protein Zeta 1 (zygin I) (FEZ1, Accession NM_022549), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to C. elegans UNC-76. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEZ1. The function of FEZ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM37.Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193) is another VGAM2434 host target gene. FZD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FZD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ ID:14484, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82232] Another function of VGAM2434 is therefore inhibition of Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled re-

ceptor family, has seven transmembrane domains. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD4. The function of FZD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309.GM2 Ganglioside Activator Protein (GM2A, Accession XM_041978) is another VGAM2434 host target gene. GM2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GM2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GM2A BINDING SITE, designated SEQ ID:33662, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82233] Another function of VGAM2434 is therefore inhibition of GM2 Ganglioside Activator Protein (GM2A, Accession XM_041978). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GM2A. G Protein-coupled Receptor 56 (GPR56, Accession NM_005682) is another

VGAM2434 host target gene. GPR56 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GPR56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR56 BINDING SITE, designated SEQ ID:12239, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82234] Another function of VGAM2434 is therefore inhibition of G Protein-coupled Receptor 56 (GPR56, Accession NM_005682), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR56. The function of GPR56 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM782.G Protein-coupled Receptor 81 (GPR81, Accession NM_032554) is another VGAM2434 host target gene. GPR81 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPR81, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR81 BINDING SITE, designated SEQ ID:26281, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82235] Another function of VGAM2434 is therefore inhibition of G Protein-coupled Receptor 81 (GPR81, Accession NM_032554). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR81. GRAF (Accession NM_015071) is another VGAM2434 host target gene. GRAF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRAF BINDING SITE, designated SEQ ID:17445, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82236] Another function of VGAM2434 is therefore inhibition of GRAF (Accession NM_015071), a gene which ia a GTPase activating protein for p21-rac. Accordingly, utilities of

VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRAF. The function of GRAF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.HCS (Accession NM_018947) is another VGAM2434 host target gene. HCS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HCS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCS BINDING SITE, designated SEQ ID:21016, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82237] Another function of VGAM2434 is therefore inhibition of HCS (Accession NM_018947). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCS. High-mobility Group 20A (HMG20A, Accession NM_018200) is another VGAM2434 host target gene. HMG20A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

HMG20A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMG20A BINDING SITE, designated SEQ ID:20074, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82238] Another function of VGAM2434 is therefore inhibition of High-mobility Group 20A (HMG20A, Accession NM_018200). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMG20A. Isocitrate Dehydrogenase 3 (NAD+) Alpha (IDH3A, Accession NM_005530) is another VGAM2434 host target gene. IDH3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IDH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDH3A BINDING SITE, designated SEQ ID:12051, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82239] Another function of VGAM2434 is therefore inhibition of Isocitrate Dehydrogenase 3 (NAD+) Alpha (IDH3A, Accession NM_005530), a gene which decarboxylates isocitrate into alpha-ketoglutarate in the TCA cycle. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDH3A. The function of IDH3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM349.Integrin, Alpha M (complement component receptor 3, alpha; also known as CD11b (p170), Macrophage Antigen Alpha Polypeptide) (ITGAM, Accession XM_050142) is another VGAM2434 host target gene. ITGAM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAM BINDING SITE, designated SEQ ID:35565, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82240] Another function of VGAM2434 is therefore inhibition of

Integrin, Alpha M (complement component receptor 3, alpha; also known as CD11b (p170), Macrophage Antigen Alpha Polypeptide) (ITGAM, Accession XM_050142), a gene which is invovled in various adhesive interactions of monocytes, macrophages and granulocytes as well as in mediating the uptake of complement-coated particles. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAM. The function of ITGAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1386.Leucine Zipper, Putative Tumor Suppressor 1 (LZTS1, Accession NM_021020) is another VGAM2434 host target gene. LZTS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LZTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTS1 BINDING SITE, designated SEQ ID:22007, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82241] Another function of VGAM2434 is therefore inhibition of Leucine Zipper, Putative Tumor Suppressor 1 (LZTS1, Accession NM_021020), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to C. elegans UNC-76. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTS1. The function of LZTS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM890.Male Germ Cell-associated Kinase (MAK, Accession NM_005906) is another VGAM2434 host target gene. MAK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAK BINDING SITE, designated SEQ ID:12531, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82242] Another function of VGAM2434 is therefore inhibition of Male Germ Cell-associated Kinase (MAK, Accession NM_005906), a gene which plays an important role in

spermatogenesis. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAK. The function of MAK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1322.MADS Box Transcription Enhancer Factor 2, Polypeptide A (myocyte enhancer factor 2A) (MEF2A, Accession NM_005587) is another VGAM2434 host target gene. MEF2A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MEF2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2A BINDING SITE, designated SEQ ID:12118, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82243] Another function of VGAM2434 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide A (myocyte enhancer factor 2A) (MEF2A, Accession NM_005587), a gene which binds a consensus sequence that regulates transcription. Accordingly, utilities of

VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2A. The function of MEF2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM46.Mediterranean Fever (MEFV, Accession NM_000243) is another VGAM2434 host target gene. MEFV BINDING SITE1 and MEFV BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MEFV, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEFV BINDING SITE1 and MEFV BINDING SITE2, designated SEQ ID:5772 and SEQ ID:5771 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82244] Another function of VGAM2434 is therefore inhibition of Mediterranean Fever (MEFV, Accession NM_000243). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEFV. MHC Class I Polypeptide-related Sequence B (MICB, Accession NM_005931) is another

VGAM2434 host target gene. MICB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MICB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MICB BINDING SITE, designated SEQ ID:12564, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82245] Another function of VGAM2434 is therefore inhibition of MHC Class I Polypeptide-related Sequence B (MICB, Accession NM_005931), a gene which involved in the presentation of foreign antigens to the immune system. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MICB. The function of MICB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Melan-A (MLANA, Accession NM_005511) is another VGAM2434 host target gene. MLANA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MLANA, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLANA BINDING SITE, designated SEQ ID:12028, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82246] Another function of VGAM2434 is therefore inhibition of Melan-A (MLANA, Accession NM_005511). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLANA. Myeloproliferative Leukemia Virus Oncogene (MPL, Accession NM_005373) is another VGAM2434 host target gene. MPL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPL BINDING SITE, designated SEQ ID:11848, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82247] Another function of VGAM2434 is therefore inhibition of Myeloproliferative Leukemia Virus Oncogene (MPL, Acces-

sion NM_005373). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPL. V-myc Myelocytomatosis Viral Oncogene Homolog 2 (avian) (MYCL2, Accession NM_005377) is another VGAM2434 host target gene. MYCL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCL2 BINDING SITE, designated SEQ ID:11855, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82248] Another function of VGAM2434 is therefore inhibition of V-myc Myelocytomatosis Viral Oncogene Homolog 2 (avian) (MYCL2, Accession NM_005377). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCL2. Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071) is another VGAM2434 host target gene. NCOA6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

NCOA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6 BINDING SITE, designated SEQ ID:15293, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82249] Another function of VGAM2434 is therefore inhibition of Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071), a gene which activates gene transcription through ligand-dependent association with coactivators. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6. The function of NCOA6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25.Non-POU Domain Containing, Octamer-binding (NONO, Accession XM_088688) is another VGAM2434 host target gene. NONO BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NONO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of NONO BINDING SITE, designated SEQ ID:39899, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82250] Another function of VGAM2434 is therefore inhibition of Non-POU Domain Containing, Octamer-binding (NONO, Accession XM_088688), a gene which is a nuclear protein which contains RNA recognition motifs. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NONO. The function of NONO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.Protocadherin Beta 9 (PCDHB9, Accession NM_019119) is another VGAM2434 host target gene. PCDHB9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB9 BINDING SITE, designated SEQ ID:21206, to the nucleotide sequence of VGAM2434 RNA,

herein designated VGAM RNA, also designated SEQ ID:5145.

[82251] Another function of VGAM2434 is therefore inhibition of Protocadherin Beta 9 (PCDHB9, Accession NM_019119), a gene which is a potential calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB9. The function of PCDHB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Phosducin-like (PDCL, Accession NM_005388) is another VGAM2434 host target gene. PDCL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDCL BINDING SITE, designated SEQ ID:11866, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82252] Another function of VGAM2434 is therefore inhibition of Phosducin-like (PDCL, Accession NM_005388), a gene

which may regulate G-protein signaling and similar to phosducins. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDCL. The function of PDCL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1708.Phosphodiesterase 6B, CGMP-specific, Rod, Beta (congenital stationary night blindness 3, autosomal dominant) (PDE6B, Accession NM_000283) is another VGAM2434 host target gene. PDE6B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE6B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE6B BINDING SITE, designated SEQ ID:5830, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82253] Another function of VGAM2434 is therefore inhibition of Phosphodiesterase 6B, CGMP-specific, Rod, Beta (congenital stationary night blindness 3, autosomal dominant) (PDE6B, Accession NM_000283). Accordingly, utili-

ties of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE6B. Period Homolog 2 (Drosophila) (PER2, Accession NM_022817) is another VGAM2434 host target gene. PER2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PER2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER2 BINDING SITE, designated SEQ ID:23090, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82254] Another function of VGAM2434 is therefore inhibition of Period Homolog 2 (Drosophila) (PER2, Accession NM_022817), a gene which Period homolog 2; putative circadian clock protein; has a PAS dimerization domain. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER2. The function of PER2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Phosphoinositide-3-kinase, Catalytic, Delta

Polypeptide (PIK3CD, Accession NM_005026) is another VGAM2434 host target gene. PIK3CD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIK3CD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3CD BINDING SITE, designated SEQ ID:11465, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82255] Another function of VGAM2434 is therefore inhibition of Phosphoinositide-3-kinase, Catalytic, Delta Polypeptide (PIK3CD, Accession NM_005026), a gene which regulating cell growth. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3CD. The function of PIK3CD has been established by previous studies. Vanhaesebroeck et al. (1997) classified p110-delta as a class I PI3K because it displayed broad in vitro lipid substrate specificity. Like p110-alpha and p110-beta, p110-delta binds p85 adaptor proteins and GTP-bound Ras. These 3 class I PI3Ks were indistinguishable at the level of p85 adaptor protein selection or recruitment to activated re-

ceptor complexes. However, unlike p110-alpha, p110-delta does not phosphorylate p85, but instead has an autophosphorylation activity Animal model experiments lend further support to the function of PIK3CD. Okkenhaug et al. (2002) generated mice expressing a catalytically inactive form of Pik3cd (asp910 to ala). They observed impaired signaling and attenuated immune responses by antigen receptors of B and T cells from these mice. The presence of Pik3ca and Pik3cb did not compensate for Pik3cd in immune function. The mutant mice also developed inflammatory bowel disease. Since the IBD7 susceptibility locus (OMIM Ref. No. 605225) maps to chromosome 1p36, the authors suggested that PIK3CD may be a candidate susceptibility gene

[82256] It is appreciated that the abovementioned animal model for PIK3CD is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[82257] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[82258] Okkenhaug, K.; Bilancio, A.; Farjot, G.; Priddle, H.; Sancho, S.; Peskett, E.; Pearce, W.; Meek, S. E.; Salpekar, A.; Water-

field, M. D.; Smith, A. J. H.; Vanhaesebroeck, B. : Impaired B and T cell antigen receptor signaling in p110-delta PI 3-kinase mutant mice. Science 297: 1031-1034, 2002. ; and

[82259] Vanhaesebroeck, B.; Welham, M. J.; Kotani, K.; Stein, R.; Warne, P. H.; Zvelebil, M. J.; Higashi, K.; Volinia, S.; Downward, J.; Waterfield, M. D. : p110-delta, a novel phosphoinositide 3-.

[82260] Further studies establishing the function and utilities of PIK3CD are found in John Hopkins OMIM database record ID 602839, and in sited publications numbered 1127-1130 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Procollagen-lysine, 2-oxoglutarate 5-dioxygenase (lysine hydroxylase, Ehlers-Danlos syndrome type VI) (PLOD, Accession NM_000302) is another VGAM2434 host target gene. PLOD BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PLOD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLOD BINDING SITE, designated SEQ ID:5845, to the nucleotide sequence of VGAM2434 RNA,

herein designated VGAM RNA, also designated SEQ ID:5145.

[82261] Another function of VGAM2434 is therefore inhibition of Procollagen-lysine, 2-oxoglutarate 5-dioxygenase (lysine hydroxylase, Ehlers-Danlos syndrome type VI) (PLOD, Accession NM_000302). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLOD. Prostaglandin E Synthase (PTGES, Accession NM_004878) is another VGAM2434 host target gene. PTGES BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTGES, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGES BINDING SITE, designated SEQ ID:11313, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82262] Another function of VGAM2434 is therefore inhibition of Prostaglandin E Synthase (PTGES, Accession NM_004878). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGES. RNA Binding Motif Protein 8A

(RBM8A, Accession NM_005105) is another VGAM2434 host target gene. RBM8A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBM8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM8A BINDING SITE, designated SEQ ID:11582, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82263] Another function of VGAM2434 is therefore inhibition of RNA Binding Motif Protein 8A (RBM8A, Accession NM_005105), a gene which involves in the pathway of gene expression postsplicing nuclear preexport mRNPs, and newly exported cytoplasmic mRNPs. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM8A. The function of RBM8A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1864.Rhesus Blood Group, D Antigen (RHD, Accession NM_016225) is another VGAM2434 host target gene. RHD BINDING SITE1 through RHD BIND-

ING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RHD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHD BINDING SITE1 through RHD BINDING SITE4, designated SEQ ID:18338, SEQ ID:18339, SEQ ID:18218 and SEQ ID:18219 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82264] Another function of VGAM2434 is therefore inhibition of Rhesus Blood Group, D Antigen (RHD, Accession NM_016225), a gene which Major antigen of the RH system. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHD. The function of RHD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563) is another VGAM2434 host target gene. SEDL BINDING SITE1 through SEDL BINDING SITE3 are HOST TARGET binding sites found in untranslated re-

gions of mRNA encoded by SEDL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEDL BINDING SITE1 through SEDL BINDING SITE3, designated SEQ ID:15911, SEQ ID:15912 and SEQ ID:15913 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82265] Another function of VGAM2434 is therefore inhibition of Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEDL. The function of SEDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.SHC (Src homology 2 domain containing) Transforming Protein 1 (SHC1, Accession NM_003029) is another VGAM2434 host target gene. SHC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SHC1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHC1 BINDING SITE, designated SEQ ID:8969, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82266] Another function of VGAM2434 is therefore inhibition of SHC (Src homology 2 domain containing) Transforming Protein 1 (SHC1, Accession NM_003029), a gene which couples activated growth factor receptors to a signaling pathway. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHC1. The function of SHC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53.TAL1 (SCL) Interrupting Locus (SIL, Accession NM_003035) is another VGAM2434 host target gene. SIL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIL BINDING SITE, designated SEQ ID:8984, to the nucleotide sequence of

VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82267] Another function of VGAM2434 is therefore inhibition of TAL1 (SCL) Interrupting Locus (SIL, Accession NM_003035), a gene which may be required for axial development and left-right specification. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIL. The function of SIL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1316.Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM_007163) is another VGAM2434 host target gene. SLC14A2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC14A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC14A2 BINDING SITE, designated SEQ ID:14012, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82268] Another function of VGAM2434 is therefore inhibition of

Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM_007163), a gene which is a renal urea transporter 2. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC14A2. The function of SLC14A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Solute Carrier Family 15 (oligopeptide transporter), Member 1 (SLC15A1, Accession NM_005073) is another VGAM2434 host target gene. SLC15A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC15A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC15A1 BINDING SITE, designated SEQ ID:11522, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82269] Another function of VGAM2434 is therefore inhibition of Solute Carrier Family 15 (oligopeptide transporter), Member 1 (SLC15A1, Accession NM_005073), a gene which is a H(+)-coupled peptide transporter. Accordingly, utilities of

VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC15A1. The function of SLC15A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.SMAC (Accession NM_138930) is another VGAM2434 host target gene. SMAC BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SMAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMAC BINDING SITE, designated SEQ ID:29049, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82270] Another function of VGAM2434 is therefore inhibition of SMAC (Accession NM_138930), a gene which promotes apoptosis via caspase activation. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAC. The function of SMAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM74.Sorting Nexin 15 (SNX15, Accession XM_057307) is another VGAM2434 host target gene. SNX15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX15 BINDING SITE, designated SEQ ID:36506, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82271] Another function of VGAM2434 is therefore inhibition of Sorting Nexin 15 (SNX15, Accession XM_057307). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX15. Synovial Sarcoma Translocation, Chromosome 18 (SS18, Accession NM_005637) is another VGAM2434 host target gene. SS18 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SS18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS18 BINDING SITE,

designated SEQ ID:12165, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82272] Another function of VGAM2434 is therefore inhibition of Synovial Sarcoma Translocation, Chromosome 18 (SS18, Accession NM_005637), a gene which is a putative transcriptional activator. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS18. The function of SS18 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Sulfotransferase Family, Cytosolic, 2B, Member 1 (SULT2B1, Accession NM_004605) is another VGAM2434 host target gene. SULT2B1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SULT2B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT2B1 BINDING SITE, designated SEQ ID:10949, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82273] Another function of VGAM2434 is therefore inhibition of Sulfotransferase Family, Cytosolic, 2B, Member 1 (SULT2B1, Accession NM_004605). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT2B1. TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190) is another VGAM2434 host target gene. TAPBP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAPBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAPBP BINDING SITE, designated SEQ ID:9183, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82274] Another function of VGAM2434 is therefore inhibition of TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190), a gene which is involved in MHC class I-restricted antigen processing. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAPBP. The function of TAPBP and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM122.Tyrosine Aminotransferase (TAT, Accession NM_000353) is another VGAM2434 host target gene. TAT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAT BINDING SITE, designated SEQ ID:5914, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82275] Another function of VGAM2434 is therefore inhibition of Tyrosine Aminotransferase (TAT, Accession NM_000353), a gene which is tyrosine aminotransferase and strongly similar to rat Rn.9947, which plays a role in gluconeogenesis. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAT. The function of TAT has been established by previous studies. Richner (1938) and Hanhart (1947) described an oculocutaneous syndrome characterized by herpetiform corneal ulcers and painful punctate keratoses of digits, palms, and soles. Richner (1938) described skin lesions in brother and sister. Only the

brother had corneal lesions. Hanhart (1947) reported that the parents of his patient were second cousins. Hanhart (1947) also described associated severe mental and somatic retardation. The pedigree he reported was reproduced by Waardenburg et al. (1961). Waardenburg et al. (1961) described children of a first-cousin marriage, one with the full syndrome and one with only corneal changes. Ventura et al. (1965) described the syndrome in 2 sons of first-cousin parents. Buist (1967) referred to studies of a child with tyrosinemia and tyrosine transaminase deficiency, but normal p-hydroxyphenylpyruvic acid oxidase. Phenylalanine level was normal. Hydroxyphenylpyruvic acid was elevated in the urine. Fellman et al. (1969) reported chemical studies on the same patient. Only the mitochondrial form of tyrosine aminotransferase (TAT) was present in the liver. The soluble form of TAT (EC 2.6.1.5) was lacking. The patient had markedly elevated tyrosine blood levels and an increase in urinary p-hydroxyphenylpyruvate and p-hydroxyphenyllactate. A regulator gene for tyrosine transaminase is X-linked (OMIM Ref. No. 314350). Goldsmith et al. (1973) demonstrated tyrosinemia and phenylaceticacidemia in this disorder. Their patient was the 14-year-old son of consan-

guineous Italian parents. The urine contained excessive P-hydroxyphenylactic acid. Urinary P-hydroxyphenylpyruvic acid was normal. Clinical and biochemical improvement accompanied low phenylalanine-low tyrosine diet. They suggested that soluble TAT may be deficient. Mitochondrial tyrosine transaminase is normal. Beinfang et al. (1976) described the ophthalmologic findings in the patient reported by Goldsmith et al. (1973). This condition is also known as tyrosinemia with palmar and plantar keratosis and keratitis. Garibaldi et al. (1977) observed this disorder, which they called oculocutaneous tyrosinosis, in a 42-month-old girl and her maternal aunt. The parents of the maternal aunt were first cousins. They emphasized the importance of early diagnosis in order to prevent mental retardation by means of a diet restricted in phenylalanine and tyrosine. Hunziker (1980) reported brother and sister with unusually late onset (about age 15). Their patients' skin lesions were improved with a diet restricted in phenylalanine and tyrosine. In a consanguineous sibship, Rehak et al. (1981) reported 4 cases of Richner-Hanhart syndrome. Cutaneous manifestations were typical but the eyes were not involved, suggesting heterogeneity in this disorder. Bohnert and Anton-Lamprecht (1982) re-

ported unique ultrastructural changes: thickening of the granular layer and increased synthesis of tonofibrils and keratohyalin; in the ridged palmar or plantar skin, large numbers of microtubules and unusually tight packing of tonofibrillar masses, which contained tubular channels or inclusions of microtubules. The authors assumed that increased cohesion and tight packing of tonofilaments prevent normal spreading of keratohyalin and result in its globular appearance. Further, they suggested that excessive amounts of intracellular tyrosine enhance crosslinks between aggregated tonofilaments. In an Ashkenazi Jewish family, Chitayat et al. (1992) observed 2 adult sibs, offspring of a first-cousin marriage, with persistent hypertyrosinemia. A curious feature was that the affected female sib, aged 41 years, had hypertyrosinemia and characteristic oculocutaneous signs; the brother, aged 39 years, had hypertyrosinemia but no oculocutaneous disease. Both sibs had 2 children; none had signs of metabolic fetopathy.

[82276] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[82277] Goldsmith, L. A.; Kang, E. S.; Bienfang, D. C.; Jimbow, K.;

Gerald, P. S.; Baden, H. P. : Tyrosinemia with plantar and palmar keratosis and keratitis. J. Pediat. 83: 798-805, 1973. ; and

[82278] Hunziker, N. : Richner-Hanhart syndrome and tyrosinemia type II. Dermatologica 160: 180-189, 1980.

[82279] Further studies establishing the function and utilities of TAT are found in John Hopkins OMIM database record ID 276600, and in sited publications numbered 8715-8728, 908 and 9088-9097 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Thromboxane A2 Receptor (TBXA2R, Accession NM_001060) is another VGAM2434 host target gene. TBXA2R BINDING SITE1 and TBXA2R BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TBXA2R, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBXA2R BINDING SITE1 and TBXA2R BINDING SITE2, designated SEQ ID:6729 and SEQ ID:6730 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82280] Another function of VGAM2434 is therefore inhibition of

Thromboxane A2 Receptor (TBXA2R, Accession NM_001060), a gene which activates Ca2+-activated chloride channels; stimulates platelet aggregation and smooth muscle constriction. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBXA2R. The function of TBXA2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM_003842) is another VGAM2434 host target gene. TNFRSF10B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFRSF10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:9940, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82281] Another function of VGAM2434 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 10b

(TNFRSF10B, Accession NM_003842), a gene which forms complex that induces apoptosis. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF10B. The function of TNFRSF10B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM400.Tumor Necrosis Factor Receptor Superfamily, Member 9 (TNFRSF9, Accession NM_001561) is another VGAM2434 host target gene. TNFRSF9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFRSF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF9 BINDING SITE, designated SEQ ID:7289, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82282] Another function of VGAM2434 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 9 (TNFRSF9, Accession NM_001561), a gene which inhibits proliferation of activated T lymphocytes. Accordingly, util-

ities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF9. The function of TNFRSF9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1954.Tripartite Motif-containing 9 (TRIM9, Accession NM_015163) is another VGAM2434 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:17519, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82283] Another function of VGAM2434 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM_015163), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked. oligosaccharides. Accordingly, utilities of VGAM2434 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_018727) is another VGAM2434 host target gene. TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRPV1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4, designated SEQ ID:20814, SEQ ID:27994, SEQ ID:28002 and SEQ ID:28010 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82284] Another function of VGAM2434 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_018727), a gene which functions as a receptor for capsaicin. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with TRPV1. The function of TRPV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM146.X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 2 (XRCC2, Accession NM_005431) is another VGAM2434 host target gene. XRCC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XRCC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XRCC2 BINDING SITE, designated SEQ ID:11901, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82285] Another function of VGAM2434 is therefore inhibition of X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 2 (XRCC2, Accession NM_005431), a gene which involves in the homologous recombination repair (hrr) pathway of double-stranded dna. Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with XRCC2. The function of XRCC2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM241.Zinc Finger Protein 22 (KOX 15) (ZNF22, Accession XM_166153) is another VGAM2434 host target gene. ZNF22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF22 BINDING SITE, designated SEQ ID:43971, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82286] Another function of VGAM2434 is therefore inhibition of Zinc Finger Protein 22 (KOX 15) (ZNF22, Accession XM_166153). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF22. Zinc Finger Protein 264 (ZNF264, Accession NM_003417) is another VGAM2434 host target gene. ZNF264 BINDING SITE1 and ZNF264 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

ZNF264, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF264 BINDING SITE1 and ZNF264 BINDING SITE2, designated SEQ ID:9455 and SEQ ID:9460 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82287] Another function of VGAM2434 is therefore inhibition of Zinc Finger Protein 264 (ZNF264, Accession NM_003417). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF264. Ankyrin Repeat and SOCS Box-containing 16 (ASB16, Accession XM_046024) is another VGAM2434 host target gene. ASB16 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ASB16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASB16 BINDING SITE, designated SEQ ID:34655, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82288] Another function of VGAM2434 is therefore inhibition of Ankyrin Repeat and SOCS Box-containing 16 (ASB16, Accession XM_046024). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB16. BA108L7.2 (Accession NM_030971) is another VGAM2434 host target gene. BA108L7.2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BA108L7.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, designated SEQ ID:25237, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82289] Another function of VGAM2434 is therefore inhibition of BA108L7.2 (Accession NM_030971). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA108L7.2. BCL2-associated Athanogene 5 (BAG5, Accession NM_004873) is another VGAM2434 host target gene. BAG5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAG5,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAG5 BINDING SITE, designated SEQ ID:11309, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82290] Another function of VGAM2434 is therefore inhibition of BCL2-associated Athanogene 5 (BAG5, Accession NM_004873). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG5. Butyrophilin, Subfamily 3, Member A1 (BTN3A1, Accession NM_007048) is another VGAM2434 host target gene. BTN3A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTN3A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN3A1 BINDING SITE, designated SEQ ID:13921, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82291] Another function of VGAM2434 is therefore inhibition of Butyrophilin, Subfamily 3, Member A1 (BTN3A1, Accession

NM_007048). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN3A1. C1q and Tumor Necrosis Factor Related Protein 6 (C1QTNF6, Accession NM_031910) is another VGAM2434 host target gene. C1QTNF6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1QTNF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF6 BINDING SITE, designated SEQ ID:25656, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82292] Another function of VGAM2434 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 6 (C1QTNF6, Accession NM_031910). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF6. C3F (Accession NM_005768) is another VGAM2434 host target gene. C3F BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C3F, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C3F BINDING SITE, designated SEQ ID:12331, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82293] Another function of VGAM2434 is therefore inhibition of C3F (Accession NM_005768). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3F. C6orf5 (Accession NM_015524) is another VGAM2434 host target gene. C6orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C6orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf5 BINDING SITE, designated SEQ ID:17780, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82294] Another function of VGAM2434 is therefore inhibition of C6orf5 (Accession NM_015524). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with C6orf5. Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM_018956) is another VGAM2434 host target gene. C9orf9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:21029, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82295] Another function of VGAM2434 is therefore inhibition of Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM_018956). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9. CDC14 Cell Division Cycle 14 Homolog B (S. cerevisiae) (CDC14B, Accession NM_033332) is another VGAM2434 host target gene. CDC14B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDC14B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:27174, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82296] Another function of VGAM2434 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (S. cerevisiae) (CDC14B, Accession NM_033332). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. Cat Eye Syndrome Chromosome Region, Candidate 1 (CECR1, Accession NM_017424) is another VGAM2434 host target gene. CECR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CECR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR1 BINDING SITE, designated SEQ ID:18884, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82297] Another function of VGAM2434 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 1

(CECR1, Accession NM_017424). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1. Chromatin Accessibility Complex 1 (CHRAC1, Accession NM_017444) is another VGAM2434 host target gene. CHRAC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHRAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRAC1 BINDING SITE, designated SEQ ID:18908, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82298] Another function of VGAM2434 is therefore inhibition of Chromatin Accessibility Complex 1 (CHRAC1, Accession NM_017444). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRAC1. CIP29 (Accession NM_032364) is another VGAM2434 host target gene. CIP29 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CIP29, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIP29 BINDING SITE, designated SEQ ID:26148, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82299] Another function of VGAM2434 is therefore inhibition of CIP29 (Accession NM_032364). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIP29. Cleavage and Polyadenylation Specific Factor 2, 100kDa (CPSF2, Accession XM_029311) is another VGAM2434 host target gene. CPSF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CPSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPSF2 BINDING SITE, designated SEQ ID:30862, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82300] Another function of VGAM2434 is therefore inhibition of Cleavage and Polyadenylation Specific Factor 2, 100kDa (CPSF2, Accession XM_029311). Accordingly, utilities of

VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF2. Cylicin, Basic Protein of Sperm Head Cytoskeleton 2 (CYLC2, Accession NM_001340) is another VGAM2434 host target gene. CYLC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYLC2 BINDING SITE, designated SEQ ID:7020, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82301] Another function of VGAM2434 is therefore inhibition of Cylicin, Basic Protein of Sperm Head Cytoskeleton 2 (CYLC2, Accession NM_001340). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYLC2. DKFZP434D146 (Accession NM_015595) is another VGAM2434 host target gene. DKFZP434D146 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434D146, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434D146 BINDING SITE, designated SEQ ID:17871, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82302] Another function of VGAM2434 is therefore inhibition of DKFZP434D146 (Accession NM_015595). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434D146. DKFZp434E2220 (Accession NM_017612) is another VGAM2434 host target gene. DKFZp434E2220 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434E2220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434E2220 BINDING SITE, designated SEQ ID:19111, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82303] Another function of VGAM2434 is therefore inhibition of DKFZp434E2220 (Accession NM_017612). Accordingly,

utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E2220. DKFZP434F0318 (Accession NM_030817) is another VGAM2434 host target gene. DKFZP434F0318 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434F0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434F0318 BINDING SITE, designated SEQ ID:25143, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82304] Another function of VGAM2434 is therefore inhibition of DKFZP434F0318 (Accession NM_030817). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F0318. DKFZP434J037 (Accession NM_030952) is another VGAM2434 host target gene. DKFZP434J037 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434J037, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J037 BINDING SITE, designated SEQ ID:25220, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82305] Another function of VGAM2434 is therefore inhibition of DKFZP434J037 (Accession NM_030952). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J037. DKFZp547H025 (Accession NM_020161) is another VGAM2434 host target gene. DKFZp547H025 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547H025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547H025 BINDING SITE, designated SEQ ID:21375, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82306] Another function of VGAM2434 is therefore inhibition of DKFZp547H025 (Accession NM_020161). Accordingly, utilities of VGAM2434 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp547H025. DKFZP564O0523 (Accession NM_032120) is another VGAM2434 host target gene. DKFZP564O0523 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O0523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0523 BINDING SITE, designated SEQ ID:25805, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82307] Another function of VGAM2434 is therefore inhibition of DKFZP564O0523 (Accession NM_032120). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0523. DKFZp762L0311 (Accession NM_018719) is another VGAM2434 host target gene. DKFZp762L0311 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp762L0311, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZp762L0311 BINDING SITE, designated SEQ ID:20799, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82308] Another function of VGAM2434 is therefore inhibition of DKFZp762L0311 (Accession NM_018719). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762L0311. Ecotropic Viral Integration Site 5 (EVI5, Accession NM_005665) is another VGAM2434 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12215, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82309] Another function of VGAM2434 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM_005665). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with EVI5. Fer-1-like 4 (C. elegans) (FER1L4, Accession NM_025206) is another VGAM2434 host target gene. FER1L4 BINDING SITE1 and FER1L4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FER1L4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FER1L4 BINDING SITE1 and FER1L4 BINDING SITE2, designated SEQ ID:24875 and SEQ ID:24876 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82310] Another function of VGAM2434 is therefore inhibition of Fer-1-like 4 (C. elegans) (FER1L4, Accession NM_025206). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FER1L4. FLJ10232 (Accession NM_018033) is another VGAM2434 host target gene. FLJ10232 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10232 BINDING SITE, designated SEQ ID:19774, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82311] Another function of VGAM2434 is therefore inhibition of FLJ10232 (Accession NM_018033). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10232. FLJ10298 (Accession NM_018050) is another VGAM2434 host target gene. FLJ10298 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10298, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10298 BINDING SITE, designated SEQ ID:19809, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82312] Another function of VGAM2434 is therefore inhibition of FLJ10298 (Accession NM_018050). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10298. FLJ10535 (Accession NM_018129) is another VGAM2434 host target gene. FLJ10535 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10535 BINDING SITE, designated SEQ ID:19917, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82313] Another function of VGAM2434 is therefore inhibition of FLJ10535 (Accession NM_018129). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10535. FLJ10713 (Accession NM_018189) is another VGAM2434 host target gene. FLJ10713 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10713 BINDING SITE, designated SEQ ID:20043, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM

RNA, also designated SEQ ID:5145.

[82314] Another function of VGAM2434 is therefore inhibition of FLJ10713 (Accession NM_018189). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10713. FLJ10901 (Accession NM_018265) is another VGAM2434 host target gene. FLJ10901 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10901 BINDING SITE, designated SEQ ID:20229, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82315] Another function of VGAM2434 is therefore inhibition of FLJ10901 (Accession NM_018265). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10901. FLJ11004 (Accession NM_018296) is another VGAM2434 host target gene. FLJ11004 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11004, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11004 BINDING SITE, designated SEQ ID:20289, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82316] Another function of VGAM2434 is therefore inhibition of FLJ11004 (Accession NM_018296). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11004. FLJ11710 (Accession NM_024846) is another VGAM2434 host target gene. FLJ11710 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11710 BINDING SITE, designated SEQ ID:24275, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82317] Another function of VGAM2434 is therefore inhibition of FLJ11710 (Accession NM_024846). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ11710. FLJ12572 (Accession NM_022905) is another VGAM2434 host target gene. FLJ12572 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12572, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12572 BINDING SITE, designated SEQ ID:23197, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82318] Another function of VGAM2434 is therefore inhibition of FLJ12572 (Accession NM_022905). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12572. FLJ12586 (Accession NM_024620) is another VGAM2434 host target gene. FLJ12586 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12586, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12586 BINDING SITE, designated SEQ ID:23883, to the nucleotide

sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82319] Another function of VGAM2434 is therefore inhibition of FLJ12586 (Accession NM_024620). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12586. FLJ12687 (Accession NM_024917) is another VGAM2434 host target gene. FLJ12687 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12687 BINDING SITE, designated SEQ ID:24447, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82320] Another function of VGAM2434 is therefore inhibition of FLJ12687 (Accession NM_024917). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12687. FLJ12903 (Accession NM_022753) is another VGAM2434 host target gene. FLJ12903 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ12903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12903 BINDING SITE, designated SEQ ID:22983, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82321] Another function of VGAM2434 is therefore inhibition of FLJ12903 (Accession NM_022753). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12903. FLJ12973 (Accession NM_024908) is another VGAM2434 host target gene. FLJ12973 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12973 BINDING SITE, designated SEQ ID:24408, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82322] Another function of VGAM2434 is therefore inhibition of FLJ12973 (Accession NM_024908). Accordingly, utilities of

VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12973. FLJ13193 (Accession NM_032177) is another VGAM2434 host target gene. FLJ13193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13193 BINDING SITE, designated SEQ ID:25891, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82323] Another function of VGAM2434 is therefore inhibition of FLJ13193 (Accession NM_032177). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13193. FLJ14950 (Accession NM_032865) is another VGAM2434 host target gene. FLJ14950 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14950

BINDING SITE, designated SEQ ID:26675, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82324] Another function of VGAM2434 is therefore inhibition of FLJ14950 (Accession NM_032865). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14950. FLJ20034 (Accession NM_017630) is another VGAM2434 host target gene. FLJ20034 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20034 BINDING SITE, designated SEQ ID:19132, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82325] Another function of VGAM2434 is therefore inhibition of FLJ20034 (Accession NM_017630). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20034. FLJ20136 (Accession NM_017684) is another VGAM2434 host target gene. FLJ20136 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20136 BINDING SITE, designated SEQ ID:19232, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82326] Another function of VGAM2434 is therefore inhibition of FLJ20136 (Accession NM_017684). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20136. FLJ20342 (Accession NM_017774) is another VGAM2434 host target gene. FLJ20342 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20342 BINDING SITE, designated SEQ ID:19398, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82327] Another function of VGAM2434 is therefore inhibition of

FLJ20342 (Accession NM_017774). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20342. FLJ20344 (Accession NM_017776) is another VGAM2434 host target gene. FLJ20344 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20344 BINDING SITE, designated SEQ ID:19405, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82328] Another function of VGAM2434 is therefore inhibition of FLJ20344 (Accession NM_017776). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20344. FLJ20507 (Accession NM_017849) is another VGAM2434 host target gene. FLJ20507 BINDING SITE1 and FLJ20507 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20507, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20507 BINDING SITE1 and FLJ20507 BINDING SITE2, designated SEQ ID:19510 and SEQ ID:30218 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82329] Another function of VGAM2434 is therefore inhibition of FLJ20507 (Accession NM_017849). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20507. FLJ22002 (Accession NM_024838) is another VGAM2434 host target gene. FLJ22002 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22002 BINDING SITE, designated SEQ ID:24249, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82330] Another function of VGAM2434 is therefore inhibition of FLJ22002 (Accession NM_024838). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ22002. FLJ22531 (Accession NM_024650) is another VGAM2434 host target gene. FLJ22531 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22531 BINDING SITE, designated SEQ ID:23946, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82331] Another function of VGAM2434 is therefore inhibition of FLJ22531 (Accession NM_024650). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22531. FLJ22794 (Accession XM_166220) is another VGAM2434 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44037, to the nucleotide

sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82332] Another function of VGAM2434 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. FLJ23024 (Accession NM_024936) is another VGAM2434 host target gene. FLJ23024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23024 BINDING SITE, designated SEQ ID:24472, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82333] Another function of VGAM2434 is therefore inhibition of FLJ23024 (Accession NM_024936). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23024. FLJ23356 (Accession NM_032237) is another VGAM2434 host target gene. FLJ23356 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ23356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23356 BINDING SITE, designated SEQ ID:25958, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82334] Another function of VGAM2434 is therefore inhibition of FLJ23356 (Accession NM_032237). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23356. FLJ23392 (Accession NM_024784) is another VGAM2434 host target gene. FLJ23392 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23392 BINDING SITE, designated SEQ ID:24160, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82335] Another function of VGAM2434 is therefore inhibition of FLJ23392 (Accession NM_024784). Accordingly, utilities of

VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23392. FLJ23563 (Accession XM_041701) is another VGAM2434 host target gene. FLJ23563 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23563 BINDING SITE, designated SEQ ID:33562, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82336] Another function of VGAM2434 is therefore inhibition of FLJ23563 (Accession XM_041701). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23563. FLJ25416 (Accession NM_145018) is another VGAM2434 host target gene. FLJ25416 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ25416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ25416

BINDING SITE, designated SEQ ID:29627, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82337] Another function of VGAM2434 is therefore inhibition of FLJ25416 (Accession NM_145018). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25416. FLJ30532 (Accession NM_144724) is another VGAM2434 host target gene. FLJ30532 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ30532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30532 BINDING SITE, designated SEQ ID:29549, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82338] Another function of VGAM2434 is therefore inhibition of FLJ30532 (Accession NM_144724). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30532. FLJ32865 (Accession NM_144613) is another VGAM2434 host target gene. FLJ32865 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:29426, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82339] Another function of VGAM2434 is therefore inhibition of FLJ32865 (Accession NM_144613). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865. GAL3ST-4 (Accession NM_024637) is another VGAM2434 host target gene. GAL3ST-4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GAL3ST-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAL3ST-4 BINDING SITE, designated SEQ ID:23910, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82340] Another function of VGAM2434 is therefore inhibition of

GAL3ST-4 (Accession NM_024637). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAL3ST-4. GMPPB (Accession XM_171044) is another VGAM2434 host target gene. GMPPB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GMPPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMPPB BINDING SITE, designated SEQ ID:45819, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82341] Another function of VGAM2434 is therefore inhibition of GMPPB (Accession XM_171044). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM_004485) is another VGAM2434 host target gene. GNG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of GNG4 BINDING SITE, designated SEQ ID:10813, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82342] Another function of VGAM2434 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM_004485). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG4. Glycoprotein V (platelet) (GP5, Accession NM_004488) is another VGAM2434 host target gene. GP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GP5 BINDING SITE, designated SEQ ID:10819, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82343] Another function of VGAM2434 is therefore inhibition of Glycoprotein V (platelet) (GP5, Accession NM_004488). Accordingly, utilities of VGAM2434 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with GP5. GREB1 (Accession NM_014668) is another VGAM2434 host target gene. GREB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GREB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GREB1 BINDING SITE, designated SEQ ID:16124, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82344] Another function of VGAM2434 is therefore inhibition of GREB1 (Accession NM_014668). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GREB1. General Transcription Factor IIE, Polypeptide 1, Alpha 56kDa (GTF2E1, Accession NM_005513) is another VGAM2434 host target gene. GTF2E1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GTF2E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2E1

BINDING SITE, designated SEQ ID:12036, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82345] Another function of VGAM2434 is therefore inhibition of General Transcription Factor IIE, Polypeptide 1, Alpha 56kDa (GTF2E1, Accession NM_005513). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2E1. GTPBG3 (Accession NM_032620) is another VGAM2434 host target gene. GTPBG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GTPBG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBG3 BINDING SITE, designated SEQ ID:26335, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82346] Another function of VGAM2434 is therefore inhibition of GTPBG3 (Accession NM_032620). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBG3. H-plk (Accession NM_015852) is another

VGAM2434 host target gene. H-plk BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by H-plk, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H-plk BINDING SITE, designated SEQ ID:17986, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82347] Another function of VGAM2434 is therefore inhibition of H-plk (Accession NM_015852). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H-plk. Histamine Receptor H4 (HRH4, Accession NM_021624) is another VGAM2434 host target gene. HRH4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH4 BINDING SITE, designated SEQ ID:22258, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82348] Another function of VGAM2434 is therefore inhibition of Histamine Receptor H4 (HRH4, Accession NM_021624). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH4. ICK (Accession NM_014920) is another VGAM2434 host target gene. ICK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:17196, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82349] Another function of VGAM2434 is therefore inhibition of ICK (Accession NM_014920). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK. Junctional Adhesion Molecule 1 (JAM1, Accession NM_144502) is another VGAM2434 host target gene. JAM1 BINDING SITE1 through JAM1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by JAM1, corresponding to HOST TAR-

GET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM1 BINDING SITE1 through JAM1 BINDING SITE4, designated SEQ ID:29331, SEQ ID:29342, SEQ ID:29352 and SEQ ID:18864 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82350] Another function of VGAM2434 is therefore inhibition of Junctional Adhesion Molecule 1 (JAM1, Accession NM_144502). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM1. KIAA0391 (Accession NM_014672) is another VGAM2434 host target gene. KIAA0391 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:16136, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82351] Another function of VGAM2434 is therefore inhibition of KIAA0391 (Accession NM_014672). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391. KIAA0426 (Accession NM_014724) is another VGAM2434 host target gene. KIAA0426 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0426 BINDING SITE, designated SEQ ID:16312, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82352] Another function of VGAM2434 is therefore inhibition of KIAA0426 (Accession NM_014724). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0426. KIAA0459 (Accession XM_027862) is another VGAM2434 host target gene. KIAA0459 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0459, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:30578, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82353] Another function of VGAM2434 is therefore inhibition of KIAA0459 (Accession XM_027862). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459. KIAA0475 (Accession NM_014864) is another VGAM2434 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16951, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82354] Another function of VGAM2434 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0475. KIAA0495 (Accession XM_031397) is another VGAM2434 host target gene. KIAA0495 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:31364, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82355] Another function of VGAM2434 is therefore inhibition of KIAA0495 (Accession XM_031397). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495. KIAA0513 (Accession NM_014732) is another VGAM2434 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16361, to the nucleotide sequence of VGAM2434 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5145.

[82356] Another function of VGAM2434 is therefore inhibition of KIAA0513 (Accession NM_014732). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA0544 (Accession XM_048119) is another VGAM2434 host target gene. KIAA0544 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0544, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0544 BINDING SITE, designated SEQ ID:35117, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82357] Another function of VGAM2434 is therefore inhibition of KIAA0544 (Accession XM_048119). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0544. KIAA0557 (Accession XM_085507) is another VGAM2434 host target gene. KIAA0557 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0557, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38212, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82358] Another function of VGAM2434 is therefore inhibition of KIAA0557 (Accession XM_085507). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. KIAA0563 (Accession NM_014834) is another VGAM2434 host target gene. KIAA0563 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE, designated SEQ ID:16841, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82359] Another function of VGAM2434 is therefore inhibition of KIAA0563 (Accession NM_014834). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0563. KIAA0594 (Accession XM_036117) is another VGAM2434 host target gene. KIAA0594 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0594 BINDING SITE, designated SEQ ID:32390, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82360] Another function of VGAM2434 is therefore inhibition of KIAA0594 (Accession XM_036117). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0594. KIAA0599 (Accession XM_085127) is another VGAM2434 host target gene. KIAA0599 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0599 BINDING SITE, designated SEQ ID:37859, to the

nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82361] Another function of VGAM2434 is therefore inhibition of KIAA0599 (Accession XM_085127). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0599. KIAA0650 (Accession XM_113962) is another VGAM2434 host target gene. KIAA0650 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0650 BINDING SITE, designated SEQ ID:42571, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82362] Another function of VGAM2434 is therefore inhibition of KIAA0650 (Accession XM_113962). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0650. KIAA0663 (Accession NM_014827) is another VGAM2434 host target gene. KIAA0663 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by KIAA0663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0663 BINDING SITE, designated SEQ ID:16814, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82363] Another function of VGAM2434 is therefore inhibition of KIAA0663 (Accession NM_014827). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0663. KIAA0676 (Accession NM_015043) is another VGAM2434 host target gene. KIAA0676 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0676 BINDING SITE, designated SEQ ID:17395, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82364] Another function of VGAM2434 is therefore inhibition of KIAA0676 (Accession NM_015043). Accordingly, utilities

of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0676. KIAA0720 (Accession XM_030970) is another VGAM2434 host target gene. KIAA0720 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0720 BINDING SITE, designated SEQ ID:31232, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82365] Another function of VGAM2434 is therefore inhibition of KIAA0720 (Accession XM_030970). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0720. KIAA0841 (Accession XM_049237) is another VGAM2434 host target gene. KIAA0841 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0841 BINDING SITE, designated SEQ ID:35363, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82366] Another function of VGAM2434 is therefore inhibition of KIAA0841 (Accession XM_049237). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841. KIAA0889 (Accession NM_015377) is another VGAM2434 host target gene. KIAA0889 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:17680, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82367] Another function of VGAM2434 is therefore inhibition of KIAA0889 (Accession NM_015377). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0889. KIAA0924 (Accession NM_014897) is another VGAM2434 host target gene. KIAA0924 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE, designated SEQ ID:17067, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82368] Another function of VGAM2434 is therefore inhibition of KIAA0924 (Accession NM_014897). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0924. KIAA1028 (Accession XM_166324) is another VGAM2434 host target gene. KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:44164, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82369] Another function of VGAM2434 is therefore inhibition of

KIAA1028 (Accession XM_166324). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028. KIAA1041 (Accession NM_014947) is another VGAM2434 host target gene. KIAA1041 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1041, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1041 BINDING SITE, designated SEQ ID:17266, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82370] Another function of VGAM2434 is therefore inhibition of KIAA1041 (Accession NM_014947). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1041. KIAA1054 (Accession XM_043493) is another VGAM2434 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:33957, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82371] Another function of VGAM2434 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. KIAA1165 (Accession XM_041162) is another VGAM2434 host target gene. KIAA1165 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1165, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1165 BINDING SITE, designated SEQ ID:33478, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82372] Another function of VGAM2434 is therefore inhibition of KIAA1165 (Accession XM_041162). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1165. KIAA1170 (Accession XM_045907) is another

VGAM2434 host target gene. KIAA1170 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1170 BINDING SITE, designated SEQ ID:34613, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82373] Another function of VGAM2434 is therefore inhibition of KIAA1170 (Accession XM_045907). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1170. KIAA1185 (Accession XM_031399) is another VGAM2434 host target gene. KIAA1185 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1185 BINDING SITE, designated SEQ ID:31369, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82374] Another function of VGAM2434 is therefore inhibition of KIAA1185 (Accession XM_031399). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1185. KIAA1198 (Accession XM_032674) is another VGAM2434 host target gene. KIAA1198 BINDING SITE1 and KIAA1198 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1198, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE1 and KIAA1198 BINDING SITE2, designated SEQ ID:31716 and SEQ ID:31718 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82375] Another function of VGAM2434 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. KIAA1320 (Accession XM_045095) is another VGAM2434 host target gene. KIAA1320 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by KIAA1320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1320 BINDING SITE, designated SEQ ID:34356, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82376] Another function of VGAM2434 is therefore inhibition of KIAA1320 (Accession XM_045095). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1320. KIAA1373 (Accession XM_048195) is another VGAM2434 host target gene. KIAA1373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1373 BINDING SITE, designated SEQ ID:35128, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82377] Another function of VGAM2434 is therefore inhibition of KIAA1373 (Accession XM_048195). Accordingly, utilities

of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1373. KIAA1467 (Accession XM_049605) is another VGAM2434 host target gene. KIAA1467 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1467, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1467 BINDING SITE, designated SEQ ID:35454, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82378] Another function of VGAM2434 is therefore inhibition of KIAA1467 (Accession XM_049605). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1467. KIAA1497 (Accession XM_041431) is another VGAM2434 host target gene. KIAA1497 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1497 BINDING SITE, designated SEQ ID:33527, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82379] Another function of VGAM2434 is therefore inhibition of KIAA1497 (Accession XM_041431). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1497. KIAA1571 (Accession XM_027744) is another VGAM2434 host target gene. KIAA1571 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1571 BINDING SITE, designated SEQ ID:30566, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82380] Another function of VGAM2434 is therefore inhibition of KIAA1571 (Accession XM_027744). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1571. KIAA1615 (Accession XM_044021) is another VGAM2434 host target gene. KIAA1615 BINDING SITE1

and KIAA1615 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1615, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE1 and KIAA1615 BINDING SITE2, designated SEQ ID:34082 and SEQ ID:34088 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82381] Another function of VGAM2434 is therefore inhibition of KIAA1615 (Accession XM_044021). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615. KIAA1737 (Accession XM_041115) is another VGAM2434 host target gene. KIAA1737 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1737 BINDING SITE, designated SEQ ID:33448, to the nucleotide sequence of VGAM2434 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5145.

[82382] Another function of VGAM2434 is therefore inhibition of KIAA1737 (Accession XM_041115). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1737. KIAA1784 (Accession XM_036660) is another VGAM2434 host target gene. KIAA1784 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1784 BINDING SITE, designated SEQ ID:32486, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82383] Another function of VGAM2434 is therefore inhibition of KIAA1784 (Accession XM_036660). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1784. KIAA1829 (Accession XM_030378) is another VGAM2434 host target gene. KIAA1829 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1829, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1829 BINDING SITE, designated SEQ ID:31031, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82384] Another function of VGAM2434 is therefore inhibition of KIAA1829 (Accession XM_030378). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1829. KIAA1854 (Accession XM_049884) is another VGAM2434 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35537, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82385] Another function of VGAM2434 is therefore inhibition of KIAA1854 (Accession XM_049884). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1854. KIAA1922 (Accession XM_057040) is another VGAM2434 host target gene. KIAA1922 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1922 BINDING SITE, designated SEQ ID:36460, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82386] Another function of VGAM2434 is therefore inhibition of KIAA1922 (Accession XM_057040). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1922. KIAA1971 (Accession XM_058720) is another VGAM2434 host target gene. KIAA1971 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1971 BINDING SITE, designated SEQ ID:36731, to the

nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82387] Another function of VGAM2434 is therefore inhibition of KIAA1971 (Accession XM_058720). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1971. KIAA1987 (Accession XM_113870) is another VGAM2434 host target gene. KIAA1987 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:42500, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82388] Another function of VGAM2434 is therefore inhibition of KIAA1987 (Accession XM_113870). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1987. Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NM_139277) is another VGAM2434 host target gene. KLK7 BINDING SITE1 and KLK7 BINDING SITE2

are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KLK7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLK7 BINDING SITE1 and KLK7 BINDING SITE2, designated SEQ ID:29274 and SEQ ID:11477 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82389] Another function of VGAM2434 is therefore inhibition of Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NM_139277). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK7. LIECG3 (Accession XM_113371) is another VGAM2434 host target gene. LIECG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIECG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIECG3 BINDING SITE, designated SEQ ID:42248, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ

ID:5145.

[82390] Another function of VGAM2434 is therefore inhibition of LIECG3 (Accession XM_113371). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIECG3. Lymphocyte Antigen 75 (LY75, Accession NM_002349) is another VGAM2434 host target gene. LY75 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LY75, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LY75 BINDING SITE, designated SEQ ID:8151, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82391] Another function of VGAM2434 is therefore inhibition of Lymphocyte Antigen 75 (LY75, Accession NM_002349). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY75. MCLC (Accession NM_015127) is another VGAM2434 host target gene. MCLC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MCLC, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCLC BINDING SITE, designated SEQ ID:17493, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82392] Another function of VGAM2434 is therefore inhibition of MCLC (Accession NM_015127). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCLC. MGC1842 (Accession XM_037797) is another VGAM2434 host target gene. MGC1842 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC1842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC1842 BINDING SITE, designated SEQ ID:32689, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82393] Another function of VGAM2434 is therefore inhibition of MGC1842 (Accession XM_037797). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC1842. MGC4638 (Accession NM_031479) is another VGAM2434 host target gene. MGC4638 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4638, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4638 BINDING SITE, designated SEQ ID:25559, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82394] Another function of VGAM2434 is therefore inhibition of MGC4638 (Accession NM_031479). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4638. MGC5149 (Accession XM_051200) is another VGAM2434 host target gene. MGC5149 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC5149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5149 BINDING SITE, designated SEQ ID:35783, to the nucleotide

sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82395] Another function of VGAM2434 is therefore inhibition of MGC5149 (Accession XM_051200). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5149. Melanoma-derived Leucine Zipper, Extra-nuclear Factor (MLZE, Accession NM_031415) is another VGAM2434 host target gene. MLZE BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MLZE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLZE BINDING SITE, designated SEQ ID:25394, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82396] Another function of VGAM2434 is therefore inhibition of Melanoma-derived Leucine Zipper, Extra-nuclear Factor (MLZE, Accession NM_031415). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLZE. Matrix Metalloproteinase-like 1 (MMPL1, Accession

NM_004142) is another VGAM2434 host target gene. MMPL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MMPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMPL1 BINDING SITE, designated SEQ ID:10349, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82397] Another function of VGAM2434 is therefore inhibition of Matrix Metalloproteinase-like 1 (MMPL1, Accession NM_004142). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMPL1. Molybdenum Cofactor Synthesis 3 (MOCS3, Accession NM_014484) is another VGAM2434 host target gene. MOCS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MOCS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOCS3 BINDING SITE, designated SEQ ID:15831, to the nucleotide se-

quence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82398] Another function of VGAM2434 is therefore inhibition of Molybdenum Cofactor Synthesis 3 (MOCS3, Accession NM_014484). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOCS3. Mitochondrial Ribosomal Protein L44 (MRPL44, Accession NM_022915) is another VGAM2434 host target gene. MRPL44 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPL44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL44 BINDING SITE, designated SEQ ID:23227, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82399] Another function of VGAM2434 is therefore inhibition of Mitochondrial Ribosomal Protein L44 (MRPL44, Accession NM_022915). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL44. Mitochondrial Ribosomal Protein S27 (MRPS27, Accession NM_015084) is

another VGAM2434 host target gene. MRPS27 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPS27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS27 BINDING SITE, designated SEQ ID:17476, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82400] Another function of VGAM2434 is therefore inhibition of Mitochondrial Ribosomal Protein S27 (MRPS27, Accession NM_015084). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS27. NDP52 (Accession NM_005831) is another VGAM2434 host target gene. NDP52 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NDP52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP52 BINDING SITE, designated SEQ ID:12443, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ

ID:5145.

[82401] Another function of VGAM2434 is therefore inhibition of NDP52 (Accession NM_005831). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDP52. NADH Dehydrogenase (ubiquinone) 1, Subcomplex Unknown, 2, 14.5kDa (NDUFC2, Accession NM_004549) is another VGAM2434 host target gene. NDUFC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NDUFC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDUFC2 BINDING SITE, designated SEQ ID:10895, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82402] Another function of VGAM2434 is therefore inhibition of NADH Dehydrogenase (ubiquinone) 1, Subcomplex Unknown, 2, 14.5kDa (NDUFC2, Accession NM_004549). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFC2. Ninjurin 2 (NINJ2, Accession NM_016533) is another VGAM2434 host target gene.

NINJ2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NINJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NINJ2 BINDING SITE, designated SEQ ID:18605, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82403] Another function of VGAM2434 is therefore inhibition of Ninjurin 2 (NINJ2, Accession NM_016533). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NINJ2. Nup43 (Accession NM_024647) is another VGAM2434 host target gene. Nup43 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Nup43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nup43 BINDING SITE, designated SEQ ID:23936, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82404] Another function of VGAM2434 is therefore inhibition of

Nup43 (Accession NM_024647). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Nup43. Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_014835) is another VGAM2434 host target gene. OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OSBPL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2, designated SEQ ID:16852 and SEQ ID:29320 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82405] Another function of VGAM2434 is therefore inhibition of Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_014835). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL2. PRO0365 (Accession NM_014126) is another VGAM2434 host target gene. PRO0365 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by PRO0365, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0365 BINDING SITE, designated SEQ ID:15386, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82406] Another function of VGAM2434 is therefore inhibition of PRO0365 (Accession NM_014126). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0365. PRO1992 (Accession NM_014107) is another VGAM2434 host target gene. PRO1992 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1992 BINDING SITE, designated SEQ ID:15333, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82407] Another function of VGAM2434 is therefore inhibition of PRO1992 (Accession NM_014107). Accordingly, utilities of

VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1992. PRO2955 (Accession NM_018545) is another VGAM2434 host target gene. PRO2955 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2955 BINDING SITE, designated SEQ ID:20621, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82408] Another function of VGAM2434 is therefore inhibition of PRO2955 (Accession NM_018545). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2955. Proline-serine-threonine Phosphatase Interacting Protein 2 (PSTPIP2, Accession NM_024430) is another VGAM2434 host target gene. PSTPIP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSTPIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PSTPIP2 BINDING SITE, designated SEQ ID:23680, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82409] Another function of VGAM2434 is therefore inhibition of Proline-serine-threonine Phosphatase Interacting Protein 2 (PSTPIP2, Accession NM_024430). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSTPIP2. RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM_031296) is another VGAM2434 host target gene. RAB33B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB33B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB33B BINDING SITE, designated SEQ ID:25331, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82410] Another function of VGAM2434 is therefore inhibition of RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM_031296). Accordingly, utilities of VGAM2434 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB33B. RAI (Accession NM_006663) is another VGAM2434 host target gene. RAI BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI BINDING SITE, designated SEQ ID:13472, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82411] Another function of VGAM2434 is therefore inhibition of RAI (Accession NM_006663). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI. RES4-25 (Accession XM_035572) is another VGAM2434 host target gene. RES4-25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RES4-25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RES4-25 BINDING SITE, designated SEQ ID:32287, to the nucleotide sequence of

VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82412] Another function of VGAM2434 is therefore inhibition of RES4-25 (Accession XM_035572). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RES4-25. SEC24 Related Gene Family, Member A (S. cerevisiae) (SEC24A, Accession XM_094581) is another VGAM2434 host target gene. SEC24A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC24A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC24A BINDING SITE, designated SEQ ID:40235, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82413] Another function of VGAM2434 is therefore inhibition of SEC24 Related Gene Family, Member A (S. cerevisiae) (SEC24A, Accession XM_094581). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC24A. Small EDRK-rich Factor 1B (centromeric) (SERF1B,

Accession NM_022978) is another VGAM2434 host target gene. SERF1B BINDING SITE1 and SERF1B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SERF1B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERF1B BINDING SITE1 and SERF1B BINDING SITE2, designated SEQ ID:23258 and SEQ ID:23259 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82414] Another function of VGAM2434 is therefore inhibition of Small EDRK-rich Factor 1B (centromeric) (SERF1B, Accession NM_022978). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERF1B.

STAF65(gamma) (Accession NM_014860) is another VGAM2434 host target gene. STAF65(gamma) BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STAF65(gamma), corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of STAF65(gamma) BINDING SITE, designated SEQ ID:16923, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82415] Another function of VGAM2434 is therefore inhibition of STAF65(gamma) (Accession NM_014860). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAF65(gamma). Tripartite Motif-containing 6 (TRIM6, Accession NM_058166) is another VGAM2434 host target gene. TRIM6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM6 BINDING SITE, designated SEQ ID:27712, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82416] Another function of VGAM2434 is therefore inhibition of Tripartite Motif-containing 6 (TRIM6, Accession NM_058166). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with TRIM6. TU12B1-TY (Accession NM_016575) is another VGAM2434 host target gene. TU12B1-TY BINDING SITE1 through TU12B1-TY BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TU12B1-TY, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU12B1-TY BINDING SITE1 through TU12B1-TY BINDING SITE3, designated SEQ ID:18646, SEQ ID:18647 and SEQ ID:18651 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82417] Another function of VGAM2434 is therefore inhibition of TU12B1-TY (Accession NM_016575). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU12B1-TY. VDU1 (Accession NM_015017) is another VGAM2434 host target gene. VDU1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VDU1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of VDU1 BINDING SITE, designated SEQ ID:17382, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82418] Another function of VGAM2434 is therefore inhibition of VDU1 (Accession NM_015017). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDU1. Vacuolar Protein Sorting 33A (yeast) (VPS33A, Accession NM_022916) is another VGAM2434 host target gene. VPS33A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VPS33A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS33A BINDING SITE, designated SEQ ID:23232, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82419] Another function of VGAM2434 is therefore inhibition of Vacuolar Protein Sorting 33A (yeast) (VPS33A, Accession NM_022916). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with VPS33A. Williams Beuren Syndrome Chromosome Region 20A (WBSCR20A, Accession NM_032158) is another VGAM2434 host target gene. WBSCR20A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WBSCR20A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR20A BINDING SITE, designated SEQ ID:25859, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82420] Another function of VGAM2434 is therefore inhibition of Williams Beuren Syndrome Chromosome Region 20A (WBSCR20A, Accession NM_032158). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR20A. Williams-Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM_025042) is another VGAM2434 host target gene. WBSCR23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WBSCR23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR23 BINDING SITE, designated SEQ ID:24641, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82421] Another function of VGAM2434 is therefore inhibition of Williams-Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM_025042). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR23. Zinc Finger Protein 185 (LIM domain) (ZNF185, Accession NM_007150) is another VGAM2434 host target gene. ZNF185 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF185 BINDING SITE, designated SEQ ID:14004, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82422] Another function of VGAM2434 is therefore inhibition of Zinc Finger Protein 185 (LIM domain) (ZNF185, Accession

NM_007150). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF185. Zinc Finger Protein 338 (ZNF338, Accession NM_022088) is another VGAM2434 host target gene. ZNF338 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF338 BINDING SITE, designated SEQ ID:22633, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82423] Another function of VGAM2434 is therefore inhibition of Zinc Finger Protein 338 (ZNF338, Accession NM_022088). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF338. ZTL1 (Accession NM_024055) is another VGAM2434 host target gene. ZTL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of ZTL1 BINDING SITE, designated SEQ ID:23491, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82424] Another function of VGAM2434 is therefore inhibition of ZTL1 (Accession NM_024055). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZTL1. LOC112817 (Accession NM_138413) is another VGAM2434 host target gene. LOC112817 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC112817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112817 BINDING SITE, designated SEQ ID:28782, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82425] Another function of VGAM2434 is therefore inhibition of LOC112817 (Accession NM_138413). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112817. LOC113675 (Accession NM_138432) is an-

other VGAM2434 host target gene. LOC113675 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC113675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113675 BINDING SITE, designated SEQ ID:28797, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82426] Another function of VGAM2434 is therefore inhibition of LOC113675 (Accession NM_138432). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113675. LOC115219 (Accession XM_055499) is another VGAM2434 host target gene. LOC115219 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC115219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115219 BINDING SITE, designated SEQ ID:36282, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82427] Another function of VGAM2434 is therefore inhibition of LOC115219 (Accession XM_055499). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115219. LOC120114 (Accession XM_061871) is another VGAM2434 host target gene. LOC120114 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120114 BINDING SITE, designated SEQ ID:37213, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82428] Another function of VGAM2434 is therefore inhibition of LOC120114 (Accession XM_061871). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120114. LOC126364 (Accession XM_065047) is another VGAM2434 host target gene. LOC126364 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126364, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126364 BINDING SITE, designated SEQ ID:37273, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82429] Another function of VGAM2434 is therefore inhibition of LOC126364 (Accession XM_065047). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126364. LOC126661 (Accession XM_059061) is another VGAM2434 host target gene. LOC126661 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126661 BINDING SITE, designated SEQ ID:36856, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82430] Another function of VGAM2434 is therefore inhibition of LOC126661 (Accession XM_059061). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC126661. LOC126669 (Accession XM_060121) is another VGAM2434 host target gene. LOC126669 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:37157, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82431] Another function of VGAM2434 is therefore inhibition of LOC126669 (Accession XM_060121). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126669. LOC132625 (Accession XM_067946) is another VGAM2434 host target gene. LOC132625 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC132625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132625 BINDING SITE, designated SEQ ID:37374, to the nucleotide sequence of VGAM2434 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5145.

[82432] Another function of VGAM2434 is therefore inhibition of LOC132625 (Accession XM_067946). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132625. LOC133686 (Accession XM_059667) is another VGAM2434 host target gene. LOC133686 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC133686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133686 BINDING SITE, designated SEQ ID:37054, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82433] Another function of VGAM2434 is therefore inhibition of LOC133686 (Accession XM_059667). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133686. LOC135293 (Accession XM_072402) is another VGAM2434 host target gene. LOC135293 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC135293, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135293 BINDING SITE, designated SEQ ID:37492, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82434] Another function of VGAM2434 is therefore inhibition of LOC135293 (Accession XM_072402). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135293. LOC135763 (Accession NM_138572) is another VGAM2434 host target gene. LOC135763 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC135763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135763 BINDING SITE, designated SEQ ID:28884, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82435] Another function of VGAM2434 is therefore inhibition of LOC135763 (Accession NM_138572). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC135763. LOC135818 (Accession XM_059804) is another VGAM2434 host target gene. LOC135818 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC135818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135818 BINDING SITE, designated SEQ ID:37095, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82436] Another function of VGAM2434 is therefore inhibition of LOC135818 (Accession XM_059804). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135818. LOC143241 (Accession NM_138812) is another VGAM2434 host target gene. LOC143241 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143241 BINDING SITE, designated SEQ ID:29035, to

the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82437] Another function of VGAM2434 is therefore inhibition of LOC143241 (Accession NM_138812). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143241. LOC145757 (Accession XM_085227) is another VGAM2434 host target gene. LOC145757 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145757, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145757 BINDING SITE, designated SEQ ID:37973, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82438] Another function of VGAM2434 is therefore inhibition of LOC145757 (Accession XM_085227). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145757. LOC146229 (Accession XM_085387) is another VGAM2434 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC146229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:38116, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82439] Another function of VGAM2434 is therefore inhibition of LOC146229 (Accession XM_085387). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. LOC146336 (Accession XM_085421) is another VGAM2434 host target gene. LOC146336 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146336 BINDING SITE, designated SEQ ID:38133, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82440] Another function of VGAM2434 is therefore inhibition of LOC146336 (Accession XM_085421). Accordingly, utilities

of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146336. LOC146346 (Accession XM_085430) is another VGAM2434 host target gene. LOC146346 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146346 BINDING SITE, designated SEQ ID:38136, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82441] Another function of VGAM2434 is therefore inhibition of LOC146346 (Accession XM_085430). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146346. LOC146455 (Accession XM_085471) is another VGAM2434 host target gene. LOC146455 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC146455 BINDING SITE, designated SEQ ID:38159, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82442] Another function of VGAM2434 is therefore inhibition of LOC146455 (Accession XM_085471). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146455. LOC146784 (Accession XM_085588) is another VGAM2434 host target gene. LOC146784 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146784 BINDING SITE, designated SEQ ID:38240, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82443] Another function of VGAM2434 is therefore inhibition of LOC146784 (Accession XM_085588). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146784. LOC146895 (Accession XM_097120) is another VGAM2434 host target gene. LOC146895 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146895 BINDING SITE, designated SEQ ID:40760, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82444] Another function of VGAM2434 is therefore inhibition of LOC146895 (Accession XM_097120). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146895. LOC146909 (Accession XM_085634) is another VGAM2434 host target gene. LOC146909 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146909 BINDING SITE, designated SEQ ID:38268, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82445] Another function of VGAM2434 is therefore inhibition of

LOC146909 (Accession XM_085634). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146909. LOC146952 (Accession XM_097138) is another VGAM2434 host target gene. LOC146952 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146952 BINDING SITE, designated SEQ ID:40769, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82446] Another function of VGAM2434 is therefore inhibition of LOC146952 (Accession XM_097138). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146952. LOC147071 (Accession XM_054031) is another VGAM2434 host target gene. LOC147071 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC147071 BINDING SITE, designated SEQ ID:36135, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82447] Another function of VGAM2434 is therefore inhibition of LOC147071 (Accession XM_054031). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071. LOC147093 (Accession XM_097184) is another VGAM2434 host target gene. LOC147093 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147093 BINDING SITE, designated SEQ ID:40806, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82448] Another function of VGAM2434 is therefore inhibition of LOC147093 (Accession XM_097184). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147093. LOC147429 (Accession XM_085793) is an-

other VGAM2434 host target gene. LOC147429 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147429 BINDING SITE, designated SEQ ID:38338, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82449] Another function of VGAM2434 is therefore inhibition of LOC147429 (Accession XM_085793). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147429. LOC147660 (Accession XM_085825) is another VGAM2434 host target gene. LOC147660 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147660, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147660 BINDING SITE, designated SEQ ID:38350, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82450] Another function of VGAM2434 is therefore inhibition of LOC147660 (Accession XM_085825). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147660. LOC147817 (Accession XM_085903) is another VGAM2434 host target gene. LOC147817 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147817 BINDING SITE, designated SEQ ID:38389, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82451] Another function of VGAM2434 is therefore inhibition of LOC147817 (Accession XM_085903). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147817. LOC148137 (Accession NM_144692) is another VGAM2434 host target gene. LOC148137 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148137, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148137 BINDING SITE, designated SEQ ID:29519, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82452] Another function of VGAM2434 is therefore inhibition of LOC148137 (Accession NM_144692). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148137. LOC148189 (Accession XM_086087) is another VGAM2434 host target gene. LOC148189 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148189 BINDING SITE, designated SEQ ID:38486, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82453] Another function of VGAM2434 is therefore inhibition of LOC148189 (Accession XM_086087). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC148189. LOC149506 (Accession XM_097661) is another VGAM2434 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:41006, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82454] Another function of VGAM2434 is therefore inhibition of LOC149506 (Accession XM_097661). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506. LOC149577 (Accession XM_097675) is another VGAM2434 host target gene. LOC149577 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149577 BINDING SITE, designated SEQ ID:41025, to the nucleotide sequence of VGAM2434 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5145.

[82455] Another function of VGAM2434 is therefore inhibition of LOC149577 (Accession XM_097675). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149577. LOC149703 (Accession XM_097719) is another VGAM2434 host target gene. LOC149703 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149703, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149703 BINDING SITE, designated SEQ ID:41064, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82456] Another function of VGAM2434 is therefore inhibition of LOC149703 (Accession XM_097719). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149703. LOC150397 (Accession XM_086907) is another VGAM2434 host target gene. LOC150397 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150397, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150397 BINDING SITE, designated SEQ ID:38962, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82457] Another function of VGAM2434 is therefore inhibition of LOC150397 (Accession XM_086907). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150397. LOC150960 (Accession XM_087059) is another VGAM2434 host target gene. LOC150960 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150960 BINDING SITE, designated SEQ ID:39031, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82458] Another function of VGAM2434 is therefore inhibition of LOC150960 (Accession XM_087059). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150960. LOC151057 (Accession XM_097998) is another VGAM2434 host target gene. LOC151057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151057 BINDING SITE, designated SEQ ID:41293, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82459] Another function of VGAM2434 is therefore inhibition of LOC151057 (Accession XM_097998). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151057. LOC151475 (Accession XM_098063) is another VGAM2434 host target gene. LOC151475 BINDING SITE1 and LOC151475 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC151475, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151475 BINDING SITE1

and LOC151475 BINDING SITE2, designated SEQ ID:41354 and SEQ ID:41360 respectively, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82460] Another function of VGAM2434 is therefore inhibition of LOC151475 (Accession XM_098063). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151475. LOC151826 (Accession XM_087312) is another VGAM2434 host target gene. LOC151826 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151826 BINDING SITE, designated SEQ ID:39166, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82461] Another function of VGAM2434 is therefore inhibition of LOC151826 (Accession XM_087312). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151826. LOC152343 (Accession XM_087441) is an-

other VGAM2434 host target gene. LOC152343 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152343 BINDING SITE, designated SEQ ID:39264, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82462] Another function of VGAM2434 is therefore inhibition of LOC152343 (Accession XM_087441). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152343. LOC152445 (Accession XM_098231) is another VGAM2434 host target gene. LOC152445 BINDING SITE1 and LOC152445 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC152445, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152445 BINDING SITE1 and LOC152445 BINDING SITE2, designated SEQ ID:41509 and SEQ ID:41513 respectively, to the nucleotide se-

quence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82463] Another function of VGAM2434 is therefore inhibition of LOC152445 (Accession XM_098231). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152445. LOC152794 (Accession XM_087525) is another VGAM2434 host target gene. LOC152794 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152794 BINDING SITE, designated SEQ ID:39321, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82464] Another function of VGAM2434 is therefore inhibition of LOC152794 (Accession XM_087525). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152794. LOC152925 (Accession XM_087559) is another VGAM2434 host target gene. LOC152925 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC152925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152925 BINDING SITE, designated SEQ ID:39331, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82465] Another function of VGAM2434 is therefore inhibition of LOC152925 (Accession XM_087559). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152925. LOC153077 (Accession XM_098307) is another VGAM2434 host target gene. LOC153077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:41570, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82466] Another function of VGAM2434 is therefore inhibition of LOC153077 (Accession XM_098307). Accordingly, utilities

of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153077. LOC153883 (Accession XM_087798) is another VGAM2434 host target gene. LOC153883 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153883, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153883 BINDING SITE, designated SEQ ID:39431, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82467] Another function of VGAM2434 is therefore inhibition of LOC153883 (Accession XM_087798). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153883. LOC154282 (Accession XM_098505) is another VGAM2434 host target gene. LOC154282 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC154282 BINDING SITE, designated SEQ ID:41701, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82468] Another function of VGAM2434 is therefore inhibition of LOC154282 (Accession XM_098505). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154282. LOC154726 (Accession XM_088024) is another VGAM2434 host target gene. LOC154726 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154726 BINDING SITE, designated SEQ ID:39478, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82469] Another function of VGAM2434 is therefore inhibition of LOC154726 (Accession XM_088024). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154726. LOC154877 (Accession XM_098626) is another VGAM2434 host target gene. LOC154877 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:41746, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82470] Another function of VGAM2434 is therefore inhibition of LOC154877 (Accession XM_098626). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877. LOC154930 (Accession XM_088080) is another VGAM2434 host target gene. LOC154930 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154930 BINDING SITE, designated SEQ ID:39505, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82471] Another function of VGAM2434 is therefore inhibition of

LOC154930 (Accession XM_088080). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154930. LOC157798 (Accession XM_098827) is another VGAM2434 host target gene. LOC157798 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157798 BINDING SITE, designated SEQ ID:41852, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82472] Another function of VGAM2434 is therefore inhibition of LOC157798 (Accession XM_098827). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157798. LOC158549 (Accession XM_098963) is another VGAM2434 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42011, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82473] Another function of VGAM2434 is therefore inhibition of LOC158549 (Accession XM_098963). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158549. LOC158668 (Accession XM_045161) is another VGAM2434 host target gene. LOC158668 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158668 BINDING SITE, designated SEQ ID:34379, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82474] Another function of VGAM2434 is therefore inhibition of LOC158668 (Accession XM_045161). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158668. LOC158865 (Accession XM_099000) is an-

other VGAM2434 host target gene. LOC158865 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158865 BINDING SITE, designated SEQ ID:42038, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82475] Another function of VGAM2434 is therefore inhibition of LOC158865 (Accession XM_099000). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158865. LOC160646 (Accession XM_090413) is another VGAM2434 host target gene. LOC160646 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC160646, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160646 BINDING SITE, designated SEQ ID:40005, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82476] Another function of VGAM2434 is therefore inhibition of LOC160646 (Accession XM_090413). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160646. LOC161829 (Accession XM_091161) is another VGAM2434 host target gene. LOC161829 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC161829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161829 BINDING SITE, designated SEQ ID:40040, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82477] Another function of VGAM2434 is therefore inhibition of LOC161829 (Accession XM_091161). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161829. LOC169611 (Accession XM_095809) is another VGAM2434 host target gene. LOC169611 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC169611, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169611 BINDING SITE, designated SEQ ID:40287, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82478] Another function of VGAM2434 is therefore inhibition of LOC169611 (Accession XM_095809). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169611. LOC196047 (Accession XM_116883) is another VGAM2434 host target gene. LOC196047 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196047 BINDING SITE, designated SEQ ID:43147, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82479] Another function of VGAM2434 is therefore inhibition of LOC196047 (Accession XM_116883). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196047. LOC196264 (Accession XM_113683) is another VGAM2434 host target gene. LOC196264 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196264 BINDING SITE, designated SEQ ID:42334, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82480] Another function of VGAM2434 is therefore inhibition of LOC196264 (Accession XM_113683). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196264. LOC196411 (Accession XM_113714) is another VGAM2434 host target gene. LOC196411 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196411 BINDING SITE, designated SEQ ID:42366, to the nucleotide sequence of VGAM2434 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5145.

[82481] Another function of VGAM2434 is therefore inhibition of LOC196411 (Accession XM_113714). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196411. LOC196529 (Accession XM_113746) is another VGAM2434 host target gene. LOC196529 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196529 BINDING SITE, designated SEQ ID:42411, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82482] Another function of VGAM2434 is therefore inhibition of LOC196529 (Accession XM_113746). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196529. LOC199786 (Accession XM_114021) is another VGAM2434 host target gene. LOC199786 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199786, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199786 BINDING SITE, designated SEQ ID:42621, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82483] Another function of VGAM2434 is therefore inhibition of LOC199786 (Accession XM_114021). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199786. LOC200169 (Accession XM_117200) is another VGAM2434 host target gene. LOC200169 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200169 BINDING SITE, designated SEQ ID:43284, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82484] Another function of VGAM2434 is therefore inhibition of LOC200169 (Accession XM_117200). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC200169. LOC200310 (Accession XM_037840) is another VGAM2434 host target gene. LOC200310 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200310 BINDING SITE, designated SEQ ID:32706, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82485] Another function of VGAM2434 is therefore inhibition of LOC200310 (Accession XM_037840). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200310. LOC200314 (Accession XM_117225) is another VGAM2434 host target gene. LOC200314 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200314, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200314 BINDING SITE, designated SEQ ID:43295, to

the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82486] Another function of VGAM2434 is therefore inhibition of LOC200314 (Accession XM_117225). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200314. LOC200845 (Accession XM_114305) is another VGAM2434 host target gene. LOC200845 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200845, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200845 BINDING SITE, designated SEQ ID:42864, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82487] Another function of VGAM2434 is therefore inhibition of LOC200845 (Accession XM_114305). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200845. LOC200860 (Accession XM_117289) is another VGAM2434 host target gene. LOC200860 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC200860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200860 BINDING SITE, designated SEQ ID:43357, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82488] Another function of VGAM2434 is therefore inhibition of LOC200860 (Accession XM_117289). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200860. LOC201173 (Accession XM_113312) is another VGAM2434 host target gene. LOC201173 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201173 BINDING SITE, designated SEQ ID:42214, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82489] Another function of VGAM2434 is therefore inhibition of LOC201173 (Accession XM_113312). Accordingly, utilities

of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201173. LOC201220 (Accession XM_113321) is another VGAM2434 host target gene. LOC201220 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201220 BINDING SITE, designated SEQ ID:42221, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82490] Another function of VGAM2434 is therefore inhibition of LOC201220 (Accession XM_113321). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201220. LOC201294 (Accession XM_113950) is another VGAM2434 host target gene. LOC201294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC201294 BINDING SITE, designated SEQ ID:42569, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82491] Another function of VGAM2434 is therefore inhibition of LOC201294 (Accession XM_113950). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201294. LOC201411 (Accession XM_031946) is another VGAM2434 host target gene. LOC201411 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201411 BINDING SITE, designated SEQ ID:31527, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82492] Another function of VGAM2434 is therefore inhibition of LOC201411 (Accession XM_031946). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201411. LOC201696 (Accession XM_032269) is another VGAM2434 host target gene. LOC201696 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201696 BINDING SITE, designated SEQ ID:31621, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82493] Another function of VGAM2434 is therefore inhibition of LOC201696 (Accession XM_032269). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201696. LOC201702 (Accession XM_114365) is another VGAM2434 host target gene. LOC201702 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201702 BINDING SITE, designated SEQ ID:42900, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82494] Another function of VGAM2434 is therefore inhibition of

LOC201702 (Accession XM_114365). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201702. LOC202025 (Accession XM_117353) is another VGAM2434 host target gene. LOC202025 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202025 BINDING SITE, designated SEQ ID:43405, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82495] Another function of VGAM2434 is therefore inhibition of LOC202025 (Accession XM_117353). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202025. LOC202934 (Accession XM_117486) is another VGAM2434 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43456, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82496] Another function of VGAM2434 is therefore inhibition of LOC202934 (Accession XM_117486). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC203297 (Accession XM_059986) is another VGAM2434 host target gene. LOC203297 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203297 BINDING SITE, designated SEQ ID:37135, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82497] Another function of VGAM2434 is therefore inhibition of LOC203297 (Accession XM_059986). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203297. LOC203339 (Accession XM_117534) is an-

other VGAM2434 host target gene. LOC203339 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203339 BINDING SITE, designated SEQ ID:43524, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82498] Another function of VGAM2434 is therefore inhibition of LOC203339 (Accession XM_117534). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203339. LOC203350 (Accession XM_117536) is another VGAM2434 host target gene. LOC203350 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:43538, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82499] Another function of VGAM2434 is therefore inhibition of LOC203350 (Accession XM_117536). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350. LOC203378 (Accession XM_117541) is another VGAM2434 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43551, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82500] Another function of VGAM2434 is therefore inhibition of LOC203378 (Accession XM_117541). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC219673 (Accession XM_167567) is another VGAM2434 host target gene. LOC219673 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219673, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219673 BINDING SITE, designated SEQ ID:44692, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82501] Another function of VGAM2434 is therefore inhibition of LOC219673 (Accession XM_167567). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219673. LOC220662 (Accession XM_165978) is another VGAM2434 host target gene. LOC220662 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220662 BINDING SITE, designated SEQ ID:43825, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82502] Another function of VGAM2434 is therefore inhibition of LOC220662 (Accession XM_165978). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC220662. LOC221296 (Accession XM_166325) is another VGAM2434 host target gene. LOC221296 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221296 BINDING SITE, designated SEQ ID:44171, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82503] Another function of VGAM2434 is therefore inhibition of LOC221296 (Accession XM_166325). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221296. LOC221773 (Accession XM_165802) is another VGAM2434 host target gene. LOC221773 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221773 BINDING SITE, designated SEQ ID:43767, to the nucleotide sequence of VGAM2434 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5145.

[82504] Another function of VGAM2434 is therefore inhibition of LOC221773 (Accession XM_165802). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221773. LOC222031 (Accession XM_168371) is another VGAM2434 host target gene. LOC222031 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222031 BINDING SITE, designated SEQ ID:45137, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82505] Another function of VGAM2434 is therefore inhibition of LOC222031 (Accession XM_168371). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222031. LOC222070 (Accession XM_168433) is another VGAM2434 host target gene. LOC222070 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222070, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222070 BINDING SITE, designated SEQ ID:45180, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82506] Another function of VGAM2434 is therefore inhibition of LOC222070 (Accession XM_168433). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222070. LOC245771 (Accession XM_167366) is another VGAM2434 host target gene. LOC245771 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC245771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245771 BINDING SITE, designated SEQ ID:44634, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82507] Another function of VGAM2434 is therefore inhibition of LOC245771 (Accession XM_167366). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC245771. LOC253664 (Accession XM_170673) is another VGAM2434 host target gene. LOC253664 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253664 BINDING SITE, designated SEQ ID:45448, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82508] Another function of VGAM2434 is therefore inhibition of LOC253664 (Accession XM_170673). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253664. LOC253666 (Accession XM_170799) is another VGAM2434 host target gene. LOC253666 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253666 BINDING SITE, designated SEQ ID:45569, to

the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82509] Another function of VGAM2434 is therefore inhibition of LOC253666 (Accession XM_170799). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253666. LOC254778 (Accession XM_171193) is another VGAM2434 host target gene. LOC254778 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254778, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254778 BINDING SITE, designated SEQ ID:45979, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82510] Another function of VGAM2434 is therefore inhibition of LOC254778 (Accession XM_171193). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254778. LOC255177 (Accession XM_172941) is another VGAM2434 host target gene. LOC255177 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC255177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255177 BINDING SITE, designated SEQ ID:46203, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82511] Another function of VGAM2434 is therefore inhibition of LOC255177 (Accession XM_172941). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255177. LOC255308 (Accession XM_170536) is another VGAM2434 host target gene. LOC255308 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255308 BINDING SITE, designated SEQ ID:45357, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82512] Another function of VGAM2434 is therefore inhibition of LOC255308 (Accession XM_170536). Accordingly, utilities

of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255308. LOC255919 (Accession XM_170794) is another VGAM2434 host target gene. LOC255919 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255919 BINDING SITE, designated SEQ ID:45555, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82513] Another function of VGAM2434 is therefore inhibition of LOC255919 (Accession XM_170794). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255919. LOC256360 (Accession XM_172918) is another VGAM2434 host target gene. LOC256360 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256360, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256360 BINDING SITE, designated SEQ ID:46176, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82514] Another function of VGAM2434 is therefore inhibition of LOC256360 (Accession XM_172918). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256360. LOC257463 (Accession XM_048605) is another VGAM2434 host target gene. LOC257463 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257463 BINDING SITE, designated SEQ ID:35212, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82515] Another function of VGAM2434 is therefore inhibition of LOC257463 (Accession XM_048605). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257463. LOC51200 (Accession NM_016352) is another VGAM2434 host target gene. LOC51200 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51200 BINDING SITE, designated SEQ ID:18481, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82516] Another function of VGAM2434 is therefore inhibition of LOC51200 (Accession NM_016352). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51200. LOC57107 (Accession NM_020381) is another VGAM2434 host target gene. LOC57107 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57107 BINDING SITE, designated SEQ ID:21653, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82517] Another function of VGAM2434 is therefore inhibition of

LOC57107 (Accession NM_020381). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57107. LOC57146 (Accession NM_020422) is another VGAM2434 host target gene. LOC57146 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57146 BINDING SITE, designated SEQ ID:21680, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82518] Another function of VGAM2434 is therefore inhibition of LOC57146 (Accession NM_020422). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57146. LOC63929 (Accession NM_022098) is another VGAM2434 host target gene. LOC63929 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC63929, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC63929 BINDING SITE, designated SEQ ID:22640, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82519] Another function of VGAM2434 is therefore inhibition of LOC63929 (Accession NM_022098). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC63929. LOC89932 (Accession XM_027341) is another VGAM2434 host target gene. LOC89932 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC89932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89932 BINDING SITE, designated SEQ ID:30494, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82520] Another function of VGAM2434 is therefore inhibition of LOC89932 (Accession XM_027341). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89932. LOC90288 (Accession XM_030669) is another

VGAM2434 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31116, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82521] Another function of VGAM2434 is therefore inhibition of LOC90288 (Accession XM_030669). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. LOC90333 (Accession XM_030958) is another VGAM2434 host target gene. LOC90333 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:31226, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82522] Another function of VGAM2434 is therefore inhibition of LOC90333 (Accession XM_030958). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. LOC90371 (Accession XM_031261) is another VGAM2434 host target gene. LOC90371 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90371 BINDING SITE, designated SEQ ID:31323, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82523] Another function of VGAM2434 is therefore inhibition of LOC90371 (Accession XM_031261). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90371. LOC90408 (Accession XM_031517) is another VGAM2434 host target gene. LOC90408 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90408, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90408 BINDING SITE, designated SEQ ID:31399, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82524] Another function of VGAM2434 is therefore inhibition of LOC90408 (Accession XM_031517). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90408. LOC90485 (Accession XM_032059) is another VGAM2434 host target gene. LOC90485 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90485 BINDING SITE, designated SEQ ID:31555, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82525] Another function of VGAM2434 is therefore inhibition of LOC90485 (Accession XM_032059). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90485. LOC91115 (Accession XM_036218) is another VGAM2434 host target gene. LOC91115 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE, designated SEQ ID:32402, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82526] Another function of VGAM2434 is therefore inhibition of LOC91115 (Accession XM_036218). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91115. LOC91308 (Accession XM_037600) is another VGAM2434 host target gene. LOC91308 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91308 BINDING SITE, designated SEQ ID:32658, to the nucleotide sequence of VGAM2434 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5145.

[82527] Another function of VGAM2434 is therefore inhibition of LOC91308 (Accession XM_037600). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91308. LOC92267 (Accession XM_043979) is another VGAM2434 host target gene. LOC92267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92267 BINDING SITE, designated SEQ ID:34058, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82528] Another function of VGAM2434 is therefore inhibition of LOC92267 (Accession XM_043979). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92267. LOC92303 (Accession XM_044108) is another VGAM2434 host target gene. LOC92303 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92303, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92303 BINDING SITE, designated SEQ ID:34136, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82529] Another function of VGAM2434 is therefore inhibition of LOC92303 (Accession XM_044108). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92303. LOC92689 (Accession XM_046663) is another VGAM2434 host target gene. LOC92689 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92689, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92689 BINDING SITE, designated SEQ ID:34784, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82530] Another function of VGAM2434 is therefore inhibition of LOC92689 (Accession XM_046663). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC92689. LOC92697 (Accession XM_046715) is another VGAM2434 host target gene. LOC92697 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92697 BINDING SITE, designated SEQ ID:34805, to the nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82531] Another function of VGAM2434 is therefore inhibition of LOC92697 (Accession XM_046715). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92697. LOC93132 (Accession XM_049396) is another VGAM2434 host target gene. LOC93132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93132 BINDING SITE, designated SEQ ID:35410, to the

nucleotide sequence of VGAM2434 RNA, herein designated VGAM RNA, also designated SEQ ID:5145.

[82532] Another function of VGAM2434 is therefore inhibition of LOC93132 (Accession XM_049396). Accordingly, utilities of VGAM2434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93132. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2435 (VGAM2435) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82533] VGAM2435 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2435 was detected is described hereinabove with reference to Figs. 1-8.

[82534] VGAM2435 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus.
VGAM2435 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82535] VGAM2435 gene encodes a VGAM2435 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2435 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2435 precursor RNA is designated SEQ ID:2421, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2421 is located at position 35753 relative to the genome of Goatpox Virus.

[82536] VGAM2435 precursor RNA folds onto itself, forming VGAM2435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82537] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2435 folded precursor RNA into VGAM2435 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2435 RNA is designated SEQ ID:5146, and is provided hereinbelow with reference to the sequence listing part.

[82538] VGAM2435 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2435 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2435 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82539] VGAM2435 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2435 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2435 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2435 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2435 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82540] The complementary binding of VGAM2435 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2435 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2435 host target RNA into VGAM2435 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82541] It is appreciated that VGAM2435 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2435 host target genes. The mRNA of each one of this plurality of VGAM2435 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2435 RNA, herein designated VGAM RNA, and which when bound by VGAM2435 RNA causes inhibition of translation of respective one or more VGAM2435 host target proteins.

[82542] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2435 gene, herein designated VGAM GENE, on one or more VGAM2435 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82543] It is yet further appreciated that a function of VGAM2435 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2435 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2435 correlate with, and may be deduced from, the identity of the host target genes which VGAM2435 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82544] Nucleotide sequences of the VGAM2435 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2435 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2435 are further described hereinbelow with reference to Table 1.

[82545] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2435 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2435 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82546] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2435 gene, herein designated VGAM is inhibition of expression of VGAM2435 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2435 correlate with, and may be deduced from, the identity of the target genes which VGAM2435 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82547] Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM_013987) is a VGAM2435 host target gene. PARK2 BINDING SITE1 through PARK2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PARK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARK2 BINDING SITE1 through PARK2 BINDING SITE3, designated SEQ ID:15150, SEQ ID:10903 and SEQ ID:15157 respectively, to the nucleotide sequence of VGAM2435 RNA, herein designated VGAM RNA, also designated SEQ

ID:5146.

[82548] A function of VGAM2435 is therefore inhibition of Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM_013987). Accordingly, utilities of VGAM2435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARK2. DKFZP564G092 (Accession NM_015601) is another VGAM2435 host target gene. DKFZP564G092 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP564G092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564G092 BINDING SITE, designated SEQ ID:17875, to the nucleotide sequence of VGAM2435 RNA, herein designated VGAM RNA, also designated SEQ ID:5146.

[82549] Another function of VGAM2435 is therefore inhibition of DKFZP564G092 (Accession NM_015601). Accordingly, utilities of VGAM2435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564G092. KIAA1271 (Accession XM_045472) is another VGAM2435 host target gene. KIAA1271 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1271 BINDING SITE, designated SEQ ID:34467, to the nucleotide sequence of VGAM2435 RNA, herein designated VGAM RNA, also designated SEQ ID:5146.

[82550] Another function of VGAM2435 is therefore inhibition of KIAA1271 (Accession XM_045472). Accordingly, utilities of VGAM2435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1271. LOC150333 (Accession XM_097874) is another VGAM2435 host target gene. LOC150333 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150333 BINDING SITE, designated SEQ ID:41195, to the nucleotide sequence of VGAM2435 RNA, herein designated VGAM RNA, also designated SEQ ID:5146.

[82551] Another function of VGAM2435 is therefore inhibition of

LOC150333 (Accession XM_097874). Accordingly, utilities of VGAM2435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150333. LOC254778 (Accession XM_171193) is another VGAM2435 host target gene. LOC254778 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254778, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254778 BINDING SITE, designated SEQ ID:45980, to the nucleotide sequence of VGAM2435 RNA, herein designated VGAM RNA, also designated SEQ ID:5146.

[82552] Another function of VGAM2435 is therefore inhibition of LOC254778 (Accession XM_171193). Accordingly, utilities of VGAM2435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254778. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2436 (VGAM2436) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[82553] VGAM2436 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2436 was detected is described hereinabove with reference to Figs. 1-8.

[82554] VGAM2436 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus.
VGAM2436 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82555] VGAM2436 gene encodes a VGAM2436 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2436 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2436 precursor RNA is designated SEQ ID:2422, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2422 is located at position 79755 relative to the genome of Goatpox Virus.

[82556] VGAM2436 precursor RNA folds onto itself, forming VGAM2436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82557] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2436 folded precursor RNA into VGAM2436 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2436 RNA is designated SEQ ID:5147, and is provided hereinbelow with reference to the sequence listing part.

[82558] VGAM2436 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2436 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2436 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82559] VGAM2436 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2436 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2436 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2436 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2436 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82560] The complementary binding of VGAM2436 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2436 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2436 host target RNA into VGAM2436 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82561] It is appreciated that VGAM2436 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2436 host target genes. The mRNA of each one of this plurality of VGAM2436 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2436 RNA, herein designated VGAM RNA, and which when bound by VGAM2436 RNA causes inhibition of translation of respective one or more VGAM2436 host target proteins.

[82562] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2436 gene, herein designated VGAM GENE, on one or more VGAM2436 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82563] It is yet further appreciated that a function of VGAM2436 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2436 correlate with, and may be deduced from, the identity of the host target genes which VGAM2436 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82564] Nucleotide sequences of the VGAM2436 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2436 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2436 are further described hereinbelow with reference to Table 1.

[82565] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2436 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2436 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82566] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2436 gene, herein designated VGAM is inhibition of expression of VGAM2436 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2436 correlate with, and may be deduced from, the identity of the target genes which VGAM2436 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82567] Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM_000838) is a VGAM2436 host target gene. GRM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM1 BINDING SITE, designated SEQ ID:6499, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82568] A function of VGAM2436 is therefore inhibition of Gluta-

mate Receptor, Metabotropic 1 (GRM1, Accession NM_000838), a gene which promotes phosphoinositide hydrolysis. Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM1. The function of GRM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM786.Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM_054111) is another VGAM2436 host target gene. IHPK3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IHPK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IHPK3 BINDING SITE, designated SEQ ID:27660, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82569] Another function of VGAM2436 is therefore inhibition of Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM_054111). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IHPK3. Paired-like Home-

odomain Transcription Factor 2 (PITX2, Accession NM_000325) is another VGAM2436 host target gene. PITX2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PITX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PITX2 BINDING SITE, designated SEQ ID:5868, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82570] Another function of VGAM2436 is therefore inhibition of Paired-like Homeodomain Transcription Factor 2 (PITX2, Accession NM_000325). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PITX2. CEP3 (Accession NM_006449) is another VGAM2436 host target gene. CEP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CEP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP3 BINDING SITE, designated SEQ ID:13157, to the nucleotide sequence of VGAM2436 RNA,

herein designated VGAM RNA, also designated SEQ ID:5147.

[82571] Another function of VGAM2436 is therefore inhibition of CEP3 (Accession NM_006449). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEP3. CCR4-NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM_013354) is another VGAM2436 host target gene. CNOT7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNOT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT7 BINDING SITE, designated SEQ ID:15000, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82572] Another function of VGAM2436 is therefore inhibition of CCR4-NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM_013354). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT7. FLJ14440 (Accession NM_032784) is another VGAM2436

host target gene. FLJ14440 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14440, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14440 BINDING SITE, designated SEQ ID:26531, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82573] Another function of VGAM2436 is therefore inhibition of FLJ14440 (Accession NM_032784). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14440. GT650 (Accession NM_052851) is another VGAM2436 host target gene. GT650 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GT650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GT650 BINDING SITE, designated SEQ ID:27432, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82574] Another function of VGAM2436 is therefore inhibition of GT650 (Accession NM_052851). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GT650. KIAA0332 (Accession XM_031553) is another VGAM2436 host target gene. KIAA0332 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0332 BINDING SITE, designated SEQ ID:31422, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82575] Another function of VGAM2436 is therefore inhibition of KIAA0332 (Accession XM_031553). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0332. KIAA1458 (Accession XM_044434) is another VGAM2436 host target gene. KIAA1458 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1458, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1458 BINDING SITE, designated SEQ ID:34205, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82576] Another function of VGAM2436 is therefore inhibition of KIAA1458 (Accession XM_044434). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1458. KIAA1813 (Accession XM_046743) is another VGAM2436 host target gene. KIAA1813 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1813 BINDING SITE, designated SEQ ID:34814, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82577] Another function of VGAM2436 is therefore inhibition of KIAA1813 (Accession XM_046743). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1813. MGC16703 (Accession XM_054591) is another VGAM2436 host target gene. MGC16703 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC16703, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16703 BINDING SITE, designated SEQ ID:36180, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82578] Another function of VGAM2436 is therefore inhibition of MGC16703 (Accession XM_054591). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16703. PRO0255 (Accession NM_014124) is another VGAM2436 host target gene. PRO0255 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO0255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0255 BINDING SITE, designated SEQ ID:15383, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM

RNA, also designated SEQ ID:5147.

[82579] Another function of VGAM2436 is therefore inhibition of PRO0255 (Accession NM_014124). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0255. LOC162239 (Accession XM_091439) is another VGAM2436 host target gene. LOC162239 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC162239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162239 BINDING SITE, designated SEQ ID:40054, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82580] Another function of VGAM2436 is therefore inhibition of LOC162239 (Accession XM_091439). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162239. LOC254848 (Accession XM_173133) is another VGAM2436 host target gene. LOC254848 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254848, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254848 BINDING SITE, designated SEQ ID:46383, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82581] Another function of VGAM2436 is therefore inhibition of LOC254848 (Accession XM_173133). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254848. LOC257443 (Accession XM_171072) is another VGAM2436 host target gene. LOC257443 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257443 BINDING SITE, designated SEQ ID:45873, to the nucleotide sequence of VGAM2436 RNA, herein designated VGAM RNA, also designated SEQ ID:5147.

[82582] Another function of VGAM2436 is therefore inhibition of LOC257443 (Accession XM_171072). Accordingly, utilities of VGAM2436 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC257443. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2437 (VGAM2437) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82583] VGAM2437 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2437 was detected is described hereinabove with reference to Figs. 1-8.

[82584] VGAM2437 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2437 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82585] VGAM2437 gene encodes a VGAM2437 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2437 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2437 precursor RNA is desig-

nated SEQ ID:2423, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2423 is located at position 32976 relative to the genome of Goatpox Virus.

[82586] VGAM2437 precursor RNA folds onto itself, forming VGAM2437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82587] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2437 folded precursor RNA into VGAM2437 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2437 RNA is designated SEQ ID:5148, and is provided hereinbelow with reference to the sequence

listing part.

[82588] VGAM2437 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2437 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2437 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82589] VGAM2437 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2437 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2437 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2437 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2437 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82590] The complementary binding of VGAM2437 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2437 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2437 host target RNA into VGAM2437 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82591] It is appreciated that VGAM2437 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2437 host target genes. The mRNA of each one of this plurality of VGAM2437 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2437 RNA, herein designated VGAM

RNA, and which when bound by VGAM2437 RNA causes inhibition of translation of respective one or more VGAM2437 host target proteins.

[82592] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2437 gene, herein designated VGAM GENE, on one or more VGAM2437 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82593] It is yet further appreciated that a function of VGAM2437 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2437 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2437 correlate with, and may be deduced from, the identity of the host target genes which VGAM2437 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82594] Nucleotide sequences of the VGAM2437 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2437 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2437 are further described hereinbelow with reference to Table 1.

[82595] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2437 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2437 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82596] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2437 gene, herein designated VGAM is

inhibition of expression of VGAM2437 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2437 correlate with, and may be deduced from, the identity of the target genes which VGAM2437 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82597] FLJ23189 (Accession NM_025057) is a VGAM2437 host target gene. FLJ23189 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23189 BINDING SITE, designated SEQ ID:24658, to the nucleotide sequence of VGAM2437 RNA, herein designated VGAM RNA, also designated SEQ ID:5148.

[82598] A function of VGAM2437 is therefore inhibition of FLJ23189 (Accession NM_025057). Accordingly, utilities of VGAM2437 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23189. PC4 (Accession NM_006713) is another VGAM2437 host target gene. PC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by PC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PC4 BINDING SITE, designated SEQ ID:13540, to the nucleotide sequence of VGAM2437 RNA, herein designated VGAM RNA, also designated SEQ ID:5148.

[82599] Another function of VGAM2437 is therefore inhibition of PC4 (Accession NM_006713). Accordingly, utilities of VGAM2437 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PC4. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2438 (VGAM2438) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82600] VGAM2438 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2438 was detected is described hereinabove with reference to Figs. 1-8.

[82601] VGAM2438 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus.

VGAM2438 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82602] VGAM2438 gene encodes a VGAM2438 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2438 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2438 precursor RNA is designated SEQ ID:2424, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2424 is located at position 88305 relative to the genome of Goatpox Virus.

[82603] VGAM2438 precursor RNA folds onto itself, forming VGAM2438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82604] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2438 folded precursor RNA into VGAM2438 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2438 RNA is designated SEQ ID:5149, and is provided hereinbelow with reference to the sequence listing part.

[82605] VGAM2438 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2438 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2438 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82606] VGAM2438 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2438 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2438 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2438 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2438 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82607] The complementary binding of VGAM2438 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2438 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2438 host target RNA into VGAM2438 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82608] It is appreciated that VGAM2438 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2438 host target genes. The mRNA of each one of this plurality of VGAM2438 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2438 RNA, herein designated VGAM RNA, and which when bound by VGAM2438 RNA causes inhibition of translation of respective one or more VGAM2438 host target proteins.

[82609] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2438 gene, herein designated VGAM GENE, on one or more VGAM2438 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82610] It is yet further appreciated that a function of VGAM2438 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2438 correlate with, and may be deduced from, the identity of the host target genes which VGAM2438 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82611] Nucleotide sequences of the VGAM2438 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2438 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2438 are further described hereinbelow with reference to Table 1.

[82612] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2438 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2438 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82613] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2438 gene, herein designated VGAM is inhibition of expression of VGAM2438 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2438 correlate with, and may be deduced from, the identity of the target genes which VGAM2438 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82614] Calcium Channel, Voltage-dependent, L Type, Alpha 1C Subunit (CACNA1C, Accession NM_000719) is a VGAM2438 host target gene. CACNA1C BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CACNA1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

CACNA1C BINDING SITE, designated SEQ ID:6379, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82615] A function of VGAM2438 is therefore inhibition of Calcium Channel, Voltage-dependent, L Type, Alpha 1C Subunit (CACNA1C, Accession NM_000719), a gene which is alpha-1 subunit of DHP-sensitive calcium channels from cardiac muscle and the brain. Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA1C. The function of CACNA1C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM182.CREBBP/EP300 Inhibitory Protein 1 (CRI1, Accession NM_014335) is another VGAM2438 host target gene. CRI1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRI1 BINDING SITE, designated SEQ ID:15648, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5149.

[82616] Another function of VGAM2438 is therefore inhibition of CREBBP/EP300 Inhibitory Protein 1 (CRI1, Accession NM_014335), a gene which regulates cell cycle as well as tissue-specific transcription and differentiation. Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRI1. The function of CRI1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM122.Fibroblast Growth Factor 7 (keratinocyte growth factor) (FGF7, Accession NM_002009) is another VGAM2438 host target gene. FGF7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FGF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF7 BINDING SITE, designated SEQ ID:7749, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82617] Another function of VGAM2438 is therefore inhibition of Fibroblast Growth Factor 7 (keratinocyte growth factor)

(FGF7, Accession NM_002009), a gene which growth factor active on keratinocytes. Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF7. The function of FGF7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM678.Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063) is another VGAM2438 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:11488, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82618] Another function of VGAM2438 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM314.FLJ10508 (Accession NM_018118) is another VGAM2438 host target gene. FLJ10508 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10508 BINDING SITE, designated SEQ ID:19892, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82619] Another function of VGAM2438 is therefore inhibition of FLJ10508 (Accession NM_018118). Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10508. FLJ21106 (Accession NM_025097) is another VGAM2438 host target gene. FLJ21106 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ21106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21106 BINDING SITE, designated SEQ ID:24735, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82620] Another function of VGAM2438 is therefore inhibition of FLJ21106 (Accession NM_025097). Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21106. KIAA0918 (Accession XM_054869) is another VGAM2438 host target gene. KIAA0918 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0918 BINDING SITE, designated SEQ ID:36197, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82621] Another function of VGAM2438 is therefore inhibition of KIAA0918 (Accession XM_054869). Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0918. KIAA1750 (Accession XM_043067) is another VGAM2438 host target gene. KIAA1750 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1750 BINDING SITE, designated SEQ ID:33872, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82622] Another function of VGAM2438 is therefore inhibition of KIAA1750 (Accession XM_043067). Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1750. PC326 (Accession NM_018442) is another VGAM2438 host target gene. PC326 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PC326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PC326 BINDING SITE, designated SEQ ID:20513, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5149.

[82623] Another function of VGAM2438 is therefore inhibition of PC326 (Accession NM_018442). Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PC326. Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 2 (STAM2, Accession NM_005843) is another VGAM2438 host target gene. STAM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAM2 BINDING SITE, designated SEQ ID:12458, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82624] Another function of VGAM2438 is therefore inhibition of Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 2 (STAM2, Accession NM_005843). Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAM2. LOC122830 (Accession XM_058661) is another VGAM2438 host target gene. LOC122830 BIND-

ING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC122830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122830 BINDING SITE, designated SEQ ID:36704, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82625] Another function of VGAM2438 is therefore inhibition of LOC122830 (Accession XM_058661). Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122830. LOC147649 (Accession XM_085830) is another VGAM2438 host target gene. LOC147649 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147649 BINDING SITE, designated SEQ ID:38355, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82626] Another function of VGAM2438 is therefore inhibition of

LOC147649 (Accession XM_085830). Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147649. LOC158116 (Accession XM_016240) is another VGAM2438 host target gene. LOC158116 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158116 BINDING SITE, designated SEQ ID:30252, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82627] Another function of VGAM2438 is therefore inhibition of LOC158116 (Accession XM_016240). Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158116. LOC257464 (Accession XM_116972) is another VGAM2438 host target gene. LOC257464 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC257464 BINDING SITE, designated SEQ ID:43164, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82628] Another function of VGAM2438 is therefore inhibition of LOC257464 (Accession XM_116972). Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257464. LOC90092 (Accession XM_028862) is another VGAM2438 host target gene. LOC90092 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90092 BINDING SITE, designated SEQ ID:30785, to the nucleotide sequence of VGAM2438 RNA, herein designated VGAM RNA, also designated SEQ ID:5149.

[82629] Another function of VGAM2438 is therefore inhibition of LOC90092 (Accession XM_028862). Accordingly, utilities of VGAM2438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90092. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2439 (VGAM2439) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82630] VGAM2439 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2439 was detected is described hereinabove with reference to Figs. 1-8.

[82631] VGAM2439 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2439 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82632] VGAM2439 gene encodes a VGAM2439 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2439 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2439 precursor RNA is designated SEQ ID:2425, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2425 is located at position 129653 relative to the genome of Goatpox Virus.

[82633] VGAM2439 precursor RNA folds onto itself, forming VGAM2439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82634] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2439 folded precursor RNA into VGAM2439 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2439 RNA is designated SEQ ID:5150, and is provided hereinbelow with reference to the sequence listing part.

[82635] VGAM2439 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2439 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2439 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82636] VGAM2439 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2439 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2439 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2439 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2439 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82637] The complementary binding of VGAM2439 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2439 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2439 host target RNA into VGAM2439 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82638] It is appreciated that VGAM2439 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2439 host target genes. The mRNA of each one of this plurality of VGAM2439 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2439 RNA, herein designated VGAM RNA, and which when bound by VGAM2439 RNA causes inhibition of translation of respective one or more

VGAM2439 host target proteins.

[82639] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2439 gene, herein designated VGAM GENE, on one or more VGAM2439 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82640] It is yet further appreciated that a function of VGAM2439 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2439 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific

functions, and accordingly utilities, of VGAM2439 correlate with, and may be deduced from, the identity of the host target genes which VGAM2439 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82641] Nucleotide sequences of the VGAM2439 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2439 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2439 are further described hereinbelow with reference to Table 1.

[82642] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2439 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2439 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82643] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2439 gene, herein designated VGAM is inhibition of expression of VGAM2439 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2439 correlate with, and may be deduced from, the identity of the target genes which VGAM2439 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82644] FK506 Binding Protein 12-rapamycin Associated Protein 1 (FRAP1, Accession NM_004958) is a VGAM2439 host target gene. FRAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FRAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRAP1 BINDING SITE, designated SEQ ID:11405, to the nucleotide sequence of VGAM2439 RNA, herein designated VGAM RNA, also designated SEQ ID:5150.

[82645] A function of VGAM2439 is therefore inhibition of FK506 Binding Protein 12-rapamycin Associated Protein 1 (FRAP1, Accession NM_004958), a gene which acts as the target for the cell-cycle arrest and immunosuppressive effects of the fkbp12-rapamycin complex. Accordingly, utilities of VGAM2439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRAP1. The function of FRAP1 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM496.Maltase-glucoamylase (alpha-glucosidase) (MGAM, Accession XM_051351) is another VGAM2439 host target gene. MGAM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAM BINDING SITE, designated SEQ ID:35826, to the nucleotide sequence of VGAM2439 RNA, herein designated VGAM RNA, also designated SEQ ID:5150.

[82646] Another function of VGAM2439 is therefore inhibition of Maltase-glucoamylase (alpha-glucosidase) (MGAM, Accession XM_051351), a gene which plays a role in the final steps of digestion of starch. Accordingly, utilities of VGAM2439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAM. The function of MGAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM791.Origin Recognition Complex, Subunit 4-like

(yeast) (ORC4L, Accession XM_030582) is another VGAM2439 host target gene. ORC4L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ORC4L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ORC4L BINDING SITE, designated SEQ ID:31090, to the nucleotide sequence of VGAM2439 RNA, herein designated VGAM RNA, also designated SEQ ID:5150.

[82647] Another function of VGAM2439 is therefore inhibition of Origin Recognition Complex, Subunit 4-like (yeast) (ORC4L, Accession XM_030582), a gene which may be required for initiation of DNA replication and has a putative nucleotide triphosphate binding motif. Accordingly, utilities of VGAM2439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ORC4L. The function of ORC4L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM599.6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 4 (PFKFB4, Accession NM_004567) is another

VGAM2439 host target gene. PFKFB4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PFKFB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFKFB4 BINDING SITE, designated SEQ ID:10908, to the nucleotide sequence of VGAM2439 RNA, herein designated VGAM RNA, also designated SEQ ID:5150.

[82648] Another function of VGAM2439 is therefore inhibition of 6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 4 (PFKFB4, Accession NM_004567), a gene which catalizes synthesis and degradation of fructose 2,6-bisphosphate. Accordingly, utilities of VGAM2439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFKFB4. The function of PFKFB4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1316.RIG (Accession NM_006394) is another VGAM2439 host target gene. RIG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RIG, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIG BINDING SITE, designated SEQ ID:13104, to the nucleotide sequence of VGAM2439 RNA, herein designated VGAM RNA, also designated SEQ ID:5150.

[82649] Another function of VGAM2439 is therefore inhibition of RIG (Accession NM_006394), a gene which is ribosomal protein S15. Accordingly, utilities of VGAM2439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIG. The function of RIG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 13 (ABCC13, Accession NM_138726) is another VGAM2439 host target gene. ABCC13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCC13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC13 BINDING SITE, designated SEQ ID:28971, to the nucleotide sequence of VGAM2439 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5150.

[82650] Another function of VGAM2439 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 13 (ABCC13, Accession NM_138726). Accordingly, utilities of VGAM2439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC13. PRO1048 (Accession NM_018497) is another VGAM2439 host target gene. PRO1048 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO1048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1048 BINDING SITE, designated SEQ ID:20560, to the nucleotide sequence of VGAM2439 RNA, herein designated VGAM RNA, also designated SEQ ID:5150.

[82651] Another function of VGAM2439 is therefore inhibition of PRO1048 (Accession NM_018497). Accordingly, utilities of VGAM2439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1048. LOC81537 (Accession NM_030791) is another VGAM2439 host target gene. LOC81537 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC81537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC81537 BINDING SITE, designated SEQ ID:25088, to the nucleotide sequence of VGAM2439 RNA, herein designated VGAM RNA, also designated SEQ ID:5150.

[82652] Another function of VGAM2439 is therefore inhibition of LOC81537 (Accession NM_030791). Accordingly, utilities of VGAM2439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC81537. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2440 (VGAM2440) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82653] VGAM2440 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2440 was detected is described hereinabove with reference to Figs. 1-8.

[82654] VGAM2440 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Goatpox Virus. VGAM2440 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82655] VGAM2440 gene encodes a VGAM2440 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2440 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2440 precursor RNA is designated SEQ ID:2426, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2426 is located at position 54822 relative to the genome of Goatpox Virus.

[82656] VGAM2440 precursor RNA folds onto itself, forming VGAM2440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82657] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2440 folded precursor RNA into VGAM2440 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2440 RNA is designated SEQ ID:5151, and is provided hereinbelow with reference to the sequence listing part.

[82658] VGAM2440 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2440 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2440 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82659] VGAM2440 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2440 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2440 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2440 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2440 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82660] The complementary binding of VGAM2440 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2440 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2440

host target RNA into VGAM2440 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82661] It is appreciated that VGAM2440 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2440 host target genes. The mRNA of each one of this plurality of VGAM2440 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2440 RNA, herein designated VGAM RNA, and which when bound by VGAM2440 RNA causes inhibition of translation of respective one or more VGAM2440 host target proteins.

[82662] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2440 gene, herein designated VGAM GENE, on one or more VGAM2440 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82663] It is yet further appreciated that a function of VGAM2440 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2440 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2440 correlate with, and may be deduced from, the identity of the host target genes which VGAM2440 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82664] Nucleotide sequences of the VGAM2440 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2440 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2440 are further

described hereinbelow with reference to Table 1.

[82665] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2440 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2440 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82666] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2440 gene, herein designated VGAM is inhibition of expression of VGAM2440 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2440 correlate with, and may be deduced from, the identity of the target genes which VGAM2440 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82667] Kruppel-like Factor 5 (intestinal) (KLF5, Accession NM_001730) is a VGAM2440 host target gene. KLF5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KLF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF5

BINDING SITE, designated SEQ ID:7461, to the nucleotide sequence of VGAM2440 RNA, herein designated VGAM RNA, also designated SEQ ID:5151.

[82668] A function of VGAM2440 is therefore inhibition of Kruppel-like Factor 5 (intestinal) (KLF5, Accession NM_001730). Accordingly, utilities of VGAM2440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF5. MAP Kinase-interacting Serine/threonine Kinase 1 (MKNK1, Accession NM_003684) is another VGAM2440 host target gene. MKNK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MKNK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKNK1 BINDING SITE, designated SEQ ID:9791, to the nucleotide sequence of VGAM2440 RNA, herein designated VGAM RNA, also designated SEQ ID:5151.

[82669] Another function of VGAM2440 is therefore inhibition of MAP Kinase-interacting Serine/threonine Kinase 1 (MKNK1, Accession NM_003684). Accordingly, utilities of VGAM2440 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MKNK1. Musculin (activated B-cell factor-1) (MSC, Accession XM_084266) is another VGAM2440 host target gene. MSC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MSC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSC BINDING SITE, designated SEQ ID:37534, to the nucleotide sequence of VGAM2440 RNA, herein designated VGAM RNA, also designated SEQ ID:5151.

[82670] Another function of VGAM2440 is therefore inhibition of Musculin (activated B-cell factor-1) (MSC, Accession XM_084266). Accordingly, utilities of VGAM2440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSC. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2441 (VGAM2441) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82671] VGAM2441 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2441 was detected is described hereinabove with reference to Figs. 1-8.

[82672] VGAM2441 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2441 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82673] VGAM2441 gene encodes a VGAM2441 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2441 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2441 precursor RNA is designated SEQ ID:2427, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2427 is located at position 482 relative to the genome of Goatpox Virus.

[82674] VGAM2441 precursor RNA folds onto itself, forming VGAM2441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82675] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2441 folded precursor RNA into VGAM2441 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2441 RNA is designated SEQ ID:5152, and is provided hereinbelow with reference to the sequence listing part.

[82676] VGAM2441 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2441 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2441 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82677] VGAM2441 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2441 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2441 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2441 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2441 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82678] The complementary binding of VGAM2441 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2441 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2441 host target RNA into VGAM2441 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82679] It is appreciated that VGAM2441 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2441 host target genes. The mRNA of each one of this plurality of VGAM2441 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2441 RNA, herein designated VGAM RNA, and which when bound by VGAM2441 RNA causes inhibition of translation of respective one or more VGAM2441 host target proteins.

[82680] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2441 gene, herein designated VGAM GENE, on one or more VGAM2441 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82681] It is yet further appreciated that a function of VGAM2441 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2441 correlate with, and may be deduced from, the identity of the host target genes which VGAM2441 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82682] Nucleotide sequences of the VGAM2441 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2441 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2441 are further described hereinbelow with reference to Table 1.

[82683] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2441 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2441 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82684] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2441 gene, herein designated VGAM is inhibition of expression of VGAM2441 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2441 correlate with, and may be deduced from, the identity of the target genes which VGAM2441 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82685] Cartilage Associated Protein (CRTAP, Accession NM_006371) is a VGAM2441 host target gene. CRTAP BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by CRTAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRTAP BINDING SITE, designated SEQ ID:13058, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82686] A function of VGAM2441 is therefore inhibition of Cartilage Associated Protein (CRTAP, Accession NM_006371), a gene which is a novel developmentally regulated chick embryo protein. Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAP. The function of CRTAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.Hippocalcin-like 1 (HPCAL1, Accession NM_134421) is another VGAM2441 host target gene. HPCAL1 BINDING SITE1 and HPCAL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HPCAL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementar-

ity of the nucleotide sequences of HPCAL1 BINDING SITE1 and HPCAL1 BINDING SITE2, designated SEQ ID:28636 and SEQ ID:7929 respectively, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82687] Another function of VGAM2441 is therefore inhibition of Hippocalcin-like 1 (HPCAL1, Accession NM_134421). Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCAL1. Aminopeptidase Puromycin Sensitive (NPEPPS, Accession NM_006310) is another VGAM2441 host target gene. NPEPPS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPEPPS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPEPPS BINDING SITE, designated SEQ ID:13000, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82688] Another function of VGAM2441 is therefore inhibition of Aminopeptidase Puromycin Sensitive (NPEPPS, Accession NM_006310), a gene which is puromycin-sensitive

aminopeptidase and has metallopeptidase activity. Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPEPPS. The function of NPEPPS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM83.Protocadherin 9 (PCDH9, Accession XM_096054) is another VGAM2441 host target gene. PCDH9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCDH9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH9 BINDING SITE, designated SEQ ID:40292, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82689] Another function of VGAM2441 is therefore inhibition of Protocadherin 9 (PCDH9, Accession XM_096054). Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH9. Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM_005068) is another VGAM2441 host

target gene. SIM1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM1 BINDING SITE, designated SEQ ID:11506, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82690] Another function of VGAM2441 is therefore inhibition of Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM_005068), a gene which may have pleiotropic effects during embryogenesis and in the adult. Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM1. The function of SIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665.Transforming Growth Factor, Alpha (TGFA, Accession NM_003236) is another VGAM2441 host target gene. TGFA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGFA, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFA BINDING SITE, designated SEQ ID:9228, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82691] Another function of VGAM2441 is therefore inhibition of Transforming Growth Factor, Alpha (TGFA, Accession NM_003236), a gene which is able to bind to the egf receptor and to act synergistically with tgf beta to promote anchorage-independent cell proliferation in soft agar. Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFA. The function of TGFA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM328.Zinc Finger Protein 265 (ZNF265, Accession NM_005455) is another VGAM2441 host target gene. ZNF265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ZNF265 BINDING SITE, designated SEQ ID:11938, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82692] Another function of VGAM2441 is therefore inhibition of Zinc Finger Protein 265 (ZNF265, Accession NM_005455). Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF265. FLJ11618 (Accession NM_022452) is another VGAM2441 host target gene. FLJ11618 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11618 BINDING SITE, designated SEQ ID:22789, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82693] Another function of VGAM2441 is therefore inhibition of FLJ11618 (Accession NM_022452). Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ11618. FLJ20651 (Accession NM_017919) is another VGAM2441 host target gene. FLJ20651 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20651 BINDING SITE, designated SEQ ID:19572, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82694] Another function of VGAM2441 is therefore inhibition of FLJ20651 (Accession NM_017919). Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20651. KIAA0379 (Accession XM_042860) is another VGAM2441 host target gene. KIAA0379 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0379, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0379 BINDING SITE, designated SEQ ID:33809, to the nucleotide sequence of VGAM2441 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5152.

[82695] Another function of VGAM2441 is therefore inhibition of KIAA0379 (Accession XM_042860). Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0379. KIAA1610 (Accession XM_040622) is another VGAM2441 host target gene. KIAA1610 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1610 BINDING SITE, designated SEQ ID:33341, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82696] Another function of VGAM2441 is therefore inhibition of KIAA1610 (Accession XM_040622). Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1610. PRO1048 (Accession NM_018497) is another VGAM2441 host target gene. PRO1048 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO1048, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1048 BINDING SITE, designated SEQ ID:20555, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82697] Another function of VGAM2441 is therefore inhibition of PRO1048 (Accession NM_018497). Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1048. LOC197319 (Accession XM_113862) is another VGAM2441 host target gene. LOC197319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197319 BINDING SITE, designated SEQ ID:42473, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82698] Another function of VGAM2441 is therefore inhibition of LOC197319 (Accession XM_113862). Accordingly, utilities of VGAM2441 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC197319. LOC90591 (Accession XM_032811) is another VGAM2441 host target gene. LOC90591 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90591, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90591 BINDING SITE, designated SEQ ID:31757, to the nucleotide sequence of VGAM2441 RNA, herein designated VGAM RNA, also designated SEQ ID:5152.

[82699] Another function of VGAM2441 is therefore inhibition of LOC90591 (Accession XM_032811). Accordingly, utilities of VGAM2441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90591. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2442 (VGAM2442) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82700] VGAM2442 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2442 was detected is described hereinabove with reference to Figs. 1-8.

[82701] VGAM2442 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2442 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82702] VGAM2442 gene encodes a VGAM2442 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2442 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2442 precursor RNA is designated SEQ ID:2428, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2428 is located at position 110320 relative to the genome of Goatpox Virus.

[82703] VGAM2442 precursor RNA folds onto itself, forming VGAM2442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82704] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2442 folded precursor RNA into VGAM2442 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2442 RNA is designated SEQ ID:5153, and is provided hereinbelow with reference to the sequence listing part.

[82705] VGAM2442 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2442 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2442 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82706] VGAM2442 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2442 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2442 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2442 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2442 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82707] The complementary binding of VGAM2442 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2442 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2442 host target RNA into VGAM2442 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82708] It is appreciated that VGAM2442 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2442 host target genes. The mRNA of each one of this plurality of VGAM2442 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2442 RNA, herein designated VGAM RNA, and which when bound by VGAM2442 RNA causes inhibition of translation of respective one or more VGAM2442 host target proteins.

[82709] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2442 gene, herein designated VGAM GENE, on one or more VGAM2442 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82710] It is yet further appreciated that a function of VGAM2442 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2442 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2442 correlate with, and may be deduced from, the identity of the host target genes which VGAM2442 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82711] Nucleotide sequences of the VGAM2442 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2442 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2442 are further described hereinbelow with reference to Table 1.

[82712] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2442 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2442 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82713] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2442 gene, herein designated VGAM is inhibition of expression of VGAM2442 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2442 correlate with, and may be deduced from, the identity of the target genes which VGAM2442 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82714] DKFZp434A2417 (Accession XM_038526) is a VGAM2442 host target gene. DKFZp434A2417 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by DKFZp434A2417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434A2417 BINDING SITE, designated SEQ ID:32861, to the nucleotide sequence of VGAM2442 RNA, herein designated VGAM RNA, also designated SEQ ID:5153.

[82715] A function of VGAM2442 is therefore inhibition of DKFZp434A2417 (Accession XM_038526). Accordingly, utilities of VGAM2442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434A2417. MacGAP (Accession NM_033515) is another VGAM2442 host target gene. MacGAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MacGAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MacGAP BINDING SITE, designated SEQ ID:27287, to the nucleotide sequence of VGAM2442 RNA, herein designated VGAM RNA, also designated SEQ ID:5153.

[82716] Another function of VGAM2442 is therefore inhibition of MacGAP (Accession NM_033515). Accordingly, utilities of

VGAM2442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MacGAP. PYGO1 (Accession XM_090986) is another VGAM2442 host target gene. PYGO1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PYGO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYGO1 BINDING SITE, designated SEQ ID:40022, to the nucleotide sequence of VGAM2442 RNA, herein designated VGAM RNA, also designated SEQ ID:5153.

[82717] Another function of VGAM2442 is therefore inhibition of PYGO1 (Accession XM_090986). Accordingly, utilities of VGAM2442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYGO1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2443 (VGAM2443) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82718] VGAM2443 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2443 was detected is described hereinabove with reference to Figs. 1-8.

[82719] VGAM2443 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2443 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82720] VGAM2443 gene encodes a VGAM2443 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2443 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2443 precursor RNA is designated SEQ ID:2429, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2429 is located at position 167632 relative to the genome of Mouse Cytomegalovirus 1.

[82721] VGAM2443 precursor RNA folds onto itself, forming VGAM2443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82722] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2443 folded precursor RNA into VGAM2443 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2443 RNA is designated SEQ ID:5154, and is provided hereinbelow with reference to the sequence listing part.

[82723] VGAM2443 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2443 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2443 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82724] VGAM2443 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2443 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2443 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2443 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2443 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82725] The complementary binding of VGAM2443 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2443 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2443 host target RNA into VGAM2443 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82726] It is appreciated that VGAM2443 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2443 host target genes. The mRNA of each one of this plurality of VGAM2443 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2443 RNA, herein designated VGAM RNA, and which when bound by VGAM2443 RNA causes inhibition of translation of respective one or more VGAM2443 host target proteins.

[82727] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2443 gene, herein designated VGAM GENE, on one or more VGAM2443 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82728] It is yet further appreciated that a function of VGAM2443 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2443 correlate with, and may be deduced from, the identity of the host target genes which VGAM2443 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82729] Nucleotide sequences of the VGAM2443 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2443 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2443 are further described hereinbelow with reference to Table 1.

[82730] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2443 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2443 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82731] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2443 gene, herein designated VGAM is inhibition of expression of VGAM2443 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2443 correlate with, and may be deduced from, the identity of the target genes which VGAM2443 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82732] EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838) is a VGAM2443 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the

5` untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41880, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82733] A function of VGAM2443 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199) is another VGAM2443 host target gene. EIF2C1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2C1 BINDING SITE, designated SEQ ID:14501, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82734] Another function of VGAM2443 is therefore inhibition of

Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199), a gene which plays an important role in the eukaryotic peptide chain initiation process. Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2C1. The function of EIF2C1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM118.Insulin Receptor Substrate 2 (IRS2, Accession XM_007095) is another VGAM2443 host target gene. IRS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IRS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRS2 BINDING SITE, designated SEQ ID:30030, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82735] Another function of VGAM2443 is therefore inhibition of Insulin Receptor Substrate 2 (IRS2, Accession XM_007095), a gene which may mediate the control of various cellular processes by insulin. Accordingly, utilities

of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRS2. The function of IRS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1217.Potassium Inwardly-rectifying Channel, Subfamily J, Member 6 (KCNJ6, Accession NM_002240) is another VGAM2443 host target gene. KCNJ6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNJ6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ6 BINDING SITE, designated SEQ ID:8022, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82736] Another function of VGAM2443 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 6 (KCNJ6, Accession NM_002240), a gene which may be involved in the regulation of insulin secretion by glucose and/or neurotransmitters. Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ6.

The function of KCNJ6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2155.Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 2 (MAP3K7IP2, Accession NM_015093) is another VGAM2443 host target gene. MAP3K7IP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K7IP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K7IP2 BINDING SITE, designated SEQ ID:17484, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82737] Another function of VGAM2443 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 2 (MAP3K7IP2, Accession NM_015093). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K7IP2. Retinoic Acid Induced 3 (RAI3, Accession NM_003979) is another VGAM2443 host target gene. RAI3 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by RAI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI3 BINDING SITE, designated SEQ ID:10112, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82738] Another function of VGAM2443 is therefore inhibition of Retinoic Acid Induced 3 (RAI3, Accession NM_003979). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI3. Stanniocalcin 1 (STC1, Accession NM_003155) is another VGAM2443 host target gene. STC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STC1 BINDING SITE, designated SEQ ID:9132, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82739] Another function of VGAM2443 is therefore inhibition of

Stanniocalcin 1 (STC1, Accession NM_003155), a gene which stimulates renal phosphate reabsorption, and could therefore prevent hypercalcemia. Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STC1. The function of STC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM623.Angiomotin (AMOT, Accession NM_133265) is another VGAM2443 host target gene. AMOT BINDING SITE1 and AMOT BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AMOT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOT BINDING SITE1 and AMOT BINDING SITE2, designated SEQ ID:28408 and SEQ ID:28409 respectively, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82740] Another function of VGAM2443 is therefore inhibition of Angiomotin (AMOT, Accession NM_133265). Accordingly, utilities of VGAM2443 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with AMOT. DKFZP434J046 (Accession XM_048258) is another VGAM2443 host target gene. DKFZP434J046 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434J046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J046 BINDING SITE, designated SEQ ID:35151, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82741] Another function of VGAM2443 is therefore inhibition of DKFZP434J046 (Accession XM_048258). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J046. FLJ12505 (Accession NM_024749) is another VGAM2443 host target gene. FLJ12505 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ12505 BINDING SITE, designated SEQ ID:24092, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82742] Another function of VGAM2443 is therefore inhibition of FLJ12505 (Accession NM_024749). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12505. KIAA0182 (Accession XM_050495) is another VGAM2443 host target gene. KIAA0182 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:35644, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82743] Another function of VGAM2443 is therefore inhibition of KIAA0182 (Accession XM_050495). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182. KIAA1028 (Accession XM_166324) is another VGAM2443 host target gene. KIAA1028 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:44159, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82744] Another function of VGAM2443 is therefore inhibition of KIAA1028 (Accession XM_166324). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028. KIAA1416 (Accession XM_098762) is another VGAM2443 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41800, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82745] Another function of VGAM2443 is therefore inhibition of

KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. Mitogen-activated Protein Kinase-activated Protein Kinase 2 (MAPKAPK2, Accession NM_004759) is another VGAM2443 host target gene. MAPKAPK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPKAPK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPKAPK2 BINDING SITE, designated SEQ ID:11149, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82746] Another function of VGAM2443 is therefore inhibition of Mitogen-activated Protein Kinase-activated Protein Kinase 2 (MAPKAPK2, Accession NM_004759). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPKAPK2. SP329 (Accession NM_030793) is another VGAM2443 host target gene. SP329 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SP329, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP329 BINDING SITE, designated SEQ ID:25095, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82747] Another function of VGAM2443 is therefore inhibition of SP329 (Accession NM_030793). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP329. Three Prime Repair Exonuclease 1 (TREX1, Accession NM_033627) is another VGAM2443 host target gene. TREX1 BINDING SITE1 and TREX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TREX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TREX1 BINDING SITE1 and TREX1 BINDING SITE2, designated SEQ ID:27337 and SEQ ID:27346 respectively, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82748] Another function of VGAM2443 is therefore inhibition of

Three Prime Repair Exonuclease 1 (TREX1, Accession NM_033627). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX1. LOC150197 (Accession XM_086801) is another VGAM2443 host target gene. LOC150197 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150197 BINDING SITE, designated SEQ ID:38865, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82749] Another function of VGAM2443 is therefore inhibition of LOC150197 (Accession XM_086801). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150197. LOC219894 (Accession XM_167782) is another VGAM2443 host target gene. LOC219894 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219894, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219894 BINDING SITE, designated SEQ ID:44795, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82750] Another function of VGAM2443 is therefore inhibition of LOC219894 (Accession XM_167782). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219894. LOC222484 (Accession XM_169424) is another VGAM2443 host target gene. LOC222484 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222484, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222484 BINDING SITE, designated SEQ ID:45298, to the nucleotide sequence of VGAM2443 RNA, herein designated VGAM RNA, also designated SEQ ID:5154.

[82751] Another function of VGAM2443 is therefore inhibition of LOC222484 (Accession XM_169424). Accordingly, utilities of VGAM2443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC222484. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2444 (VGAM2444) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82752] VGAM2444 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2444 was detected is described hereinabove with reference to Figs. 1-8.

[82753] VGAM2444 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2444 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82754] VGAM2444 gene encodes a VGAM2444 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2444 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2444 precursor RNA is designated SEQ ID:2430, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2430 is located at position 180574 relative to the genome of Mouse Cytomegalovirus 1.

[82755] VGAM2444 precursor RNA folds onto itself, forming VGAM2444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82756] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2444 folded precursor RNA into VGAM2444 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM2444 RNA is designated SEQ ID:5155, and is provided hereinbelow with reference to the sequence listing part.

[82757] VGAM2444 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2444 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2444 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82758] VGAM2444 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2444 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2444 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2444 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2444 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82759] The complementary binding of VGAM2444 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2444 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2444 host target RNA into VGAM2444 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82760] It is appreciated that VGAM2444 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2444 host target genes. The mRNA of each one of this plurality of VGAM2444 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2444 RNA, herein designated VGAM RNA, and which when bound by VGAM2444 RNA causes

inhibition of translation of respective one or more VGAM2444 host target proteins.

[82761] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2444 gene, herein designated VGAM GENE, on one or more VGAM2444 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82762] It is yet further appreciated that a function of VGAM2444 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2444 include diagnosis, prevention and

treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2444 correlate with, and may be deduced from, the identity of the host target genes which VGAM2444 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82763] Nucleotide sequences of the VGAM2444 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2444 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2444 are further described hereinbelow with reference to Table 1.

[82764] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2444 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2444 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82765] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2444 gene, herein designated VGAM is inhibition of expression of VGAM2444 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2444 correlate with, and may be deduced from, the identity of the target genes which VGAM2444 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82766] Dual Specificity Phosphatase 1 (DUSP1, Accession NM_004417) is a VGAM2444 host target gene. DUSP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DUSP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP1 BINDING SITE, designated SEQ ID:10681, to the nucleotide sequence of VGAM2444 RNA, herein designated VGAM RNA, also designated SEQ ID:5155.

[82767] A function of VGAM2444 is therefore inhibition of Dual Specificity Phosphatase 1 (DUSP1, Accession NM_004417), a gene which is a dual specificity phosphatase . Accordingly, utilities of VGAM2444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP1. The function of DUSP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

inabove with reference to VGAM881.DKFZP572C163 (Accession XM_028314) is another VGAM2444 host target gene. DKFZP572C163 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP572C163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP572C163 BINDING SITE, designated SEQ ID:30656, to the nucleotide sequence of VGAM2444 RNA, herein designated VGAM RNA, also designated SEQ ID:5155.

[82768] Another function of VGAM2444 is therefore inhibition of DKFZP572C163 (Accession XM_028314). Accordingly, utilities of VGAM2444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP572C163. EFA6R (Accession NM_015310) is another VGAM2444 host target gene. EFA6R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EFA6R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFA6R BINDING SITE, designated SEQ ID:17620, to the nucleotide se-

quence of VGAM2444 RNA, herein designated VGAM RNA, also designated SEQ ID:5155.

[82769] Another function of VGAM2444 is therefore inhibition of EFA6R (Accession NM_015310). Accordingly, utilities of VGAM2444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFA6R. ERAP140 (Accession XM_059748) is another VGAM2444 host target gene. ERAP140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ERAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERAP140 BINDING SITE, designated SEQ ID:37081, to the nucleotide sequence of VGAM2444 RNA, herein designated VGAM RNA, also designated SEQ ID:5155.

[82770] Another function of VGAM2444 is therefore inhibition of ERAP140 (Accession XM_059748). Accordingly, utilities of VGAM2444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERAP140. FLJ20413 (Accession NM_017808) is another VGAM2444 host target gene. FLJ20413 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ20413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20413 BINDING SITE, designated SEQ ID:19450, to the nucleotide sequence of VGAM2444 RNA, herein designated VGAM RNA, also designated SEQ ID:5155.

[82771] Another function of VGAM2444 is therefore inhibition of FLJ20413 (Accession NM_017808). Accordingly, utilities of VGAM2444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20413. LOC160156 (Accession XM_090047) is another VGAM2444 host target gene. LOC160156 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC160156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160156 BINDING SITE, designated SEQ ID:39989, to the nucleotide sequence of VGAM2444 RNA, herein designated VGAM RNA, also designated SEQ ID:5155.

[82772] Another function of VGAM2444 is therefore inhibition of LOC160156 (Accession XM_090047). Accordingly, utilities

of VGAM2444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160156. LOC169966 (Accession XM_093010) is another VGAM2444 host target gene. LOC169966 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC169966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169966 BINDING SITE, designated SEQ ID:40164, to the nucleotide sequence of VGAM2444 RNA, herein designated VGAM RNA, also designated SEQ ID:5155.

[82773] Another function of VGAM2444 is therefore inhibition of LOC169966 (Accession XM_093010). Accordingly, utilities of VGAM2444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169966. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2445 (VGAM2445) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82774] VGAM2445 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2445 was detected is described hereinabove with reference to Figs. 1-8.

[82775] VGAM2445 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2445 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82776] VGAM2445 gene encodes a VGAM2445 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2445 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2445 precursor RNA is designated SEQ ID:2431, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2431 is located at position 13050 relative to the genome of Mouse Cytomegalovirus 1.

[82777] VGAM2445 precursor RNA folds onto itself, forming VGAM2445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82778] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2445 folded precursor RNA into VGAM2445 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2445 RNA is designated SEQ ID:5156, and is provided hereinbelow with reference to the sequence listing part.

[82779] VGAM2445 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2445 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2445 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[82780] VGAM2445 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2445 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2445 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2445 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2445 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82781] The complementary binding of VGAM2445 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2445 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2445 host target RNA into VGAM2445 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82782] It is appreciated that VGAM2445 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2445 host target genes. The mRNA of each one of this plurality of VGAM2445 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2445 RNA, herein designated VGAM RNA, and which when bound by VGAM2445 RNA causes inhibition of translation of respective one or more VGAM2445 host target proteins.

[82783] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2445 gene, herein designated VGAM GENE, on one or more VGAM2445 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82784] It is yet further appreciated that a function of VGAM2445 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2445 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2445 correlate with, and may be deduced from, the identity of the host target genes which VGAM2445 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82785] Nucleotide sequences of the VGAM2445 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2445 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2445 are further described hereinbelow with reference to Table 1.

[82786] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2445 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2445 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82787] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2445 gene, herein designated VGAM is inhibition of expression of VGAM2445 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2445 correlate with, and may be deduced from, the identity of the target genes which VGAM2445 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82788] RAP1A, Member of RAS Oncogene Family (RAP1A, Accession NM_002884) is a VGAM2445 host target gene. RAP1A

BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP1A BINDING SITE, designated SEQ ID:8791, to the nucleotide sequence of VGAM2445 RNA, herein designated VGAM RNA, also designated SEQ ID:5156.

[82789] A function of VGAM2445 is therefore inhibition of RAP1A, Member of RAS Oncogene Family (RAP1A, Accession NM_002884), a gene which induces morphological reversion of a cell line transformed by a ras oncogene. Accordingly, utilities of VGAM2445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1A. The function of RAP1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM993.KIAA1033 (Accession XM_035313) is another VGAM2445 host target gene. KIAA1033 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1033, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1033 BINDING SITE, designated SEQ ID:32228, to the nucleotide sequence of VGAM2445 RNA, herein designated VGAM RNA, also designated SEQ ID:5156.

[82790] Another function of VGAM2445 is therefore inhibition of KIAA1033 (Accession XM_035313). Accordingly, utilities of VGAM2445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1033. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840) is another VGAM2445 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30762, to the nucleotide sequence of VGAM2445 RNA, herein designated VGAM RNA, also designated SEQ ID:5156.

[82791] Another function of VGAM2445 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840). Accordingly, utilities

of VGAM2445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2446 (VGAM2446) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82792] VGAM2446 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2446 was detected is described hereinabove with reference to Figs. 1-8.

[82793] VGAM2446 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2446 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82794] VGAM2446 gene encodes a VGAM2446 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2446 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2446 precursor RNA is designated SEQ ID:2432, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2432 is located at position 159425 relative to the genome of Mouse Cytomegalovirus 1.

[82795] VGAM2446 precursor RNA folds onto itself, forming VGAM2446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82796] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2446 folded precursor RNA into VGAM2446 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2446 RNA is designated SEQ ID:5157, and

is provided hereinbelow with reference to the sequence listing part.

[82797] VGAM2446 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2446 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2446 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82798] VGAM2446 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2446 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2446 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2446 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2446 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82799] The complementary binding of VGAM2446 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2446 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2446 host target RNA into VGAM2446 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82800] It is appreciated that VGAM2446 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2446 host target genes. The mRNA of each one of this plurality of VGAM2446 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2446 RNA, herein designated VGAM RNA, and which when bound by VGAM2446 RNA causes inhibition of translation of respective one or more VGAM2446 host target proteins.

[82801] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2446 gene, herein designated VGAM GENE, on one or more VGAM2446 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82802] It is yet further appreciated that a function of VGAM2446 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2446 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2446 correlate with, and may be deduced from, the identity of the host target genes which VGAM2446 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82803] Nucleotide sequences of the VGAM2446 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2446 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2446 are further described hereinbelow with reference to Table 1.

[82804] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2446 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2446 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82805] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2446 gene, herein designated VGAM is inhibition of expression of VGAM2446 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2446 correlate with, and may be deduced from, the identity of the target genes which VGAM2446 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82806] Contactin Associated Protein-like 2 (CNTNAP2, Accession NM_014141) is a VGAM2446 host target gene. CNTNAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNTNAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTNAP2 BINDING SITE, designated SEQ ID:15416, to the nucleotide sequence of VGAM2446 RNA, herein designated VGAM RNA, also designated SEQ ID:5157.

[82807] A function of VGAM2446 is therefore inhibition of Contactin Associated Protein-like 2 (CNTNAP2, Accession NM_014141). Accordingly, utilities of VGAM2446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTNAP2. DKFZP566B183

(Accession NM_015509) is another VGAM2446 host target gene. DKFZP566B183 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP566B183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566B183 BINDING SITE, designated SEQ ID:17768, to the nucleotide sequence of VGAM2446 RNA, herein designated VGAM RNA, also designated SEQ ID:5157.

[82808] Another function of VGAM2446 is therefore inhibition of DKFZP566B183 (Accession NM_015509). Accordingly, utilities of VGAM2446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566B183. FLJ10511 (Accession NM_018120) is another VGAM2446 host target gene. FLJ10511 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10511 BINDING SITE, designated SEQ ID:19898, to the nucleotide sequence of VGAM2446 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5157.

[82809] Another function of VGAM2446 is therefore inhibition of FLJ10511 (Accession NM_018120). Accordingly, utilities of VGAM2446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10511. FLJ13842 (Accession NM_024645) is another VGAM2446 host target gene. FLJ13842 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13842 BINDING SITE, designated SEQ ID:23929, to the nucleotide sequence of VGAM2446 RNA, herein designated VGAM RNA, also designated SEQ ID:5157.

[82810] Another function of VGAM2446 is therefore inhibition of FLJ13842 (Accession NM_024645). Accordingly, utilities of VGAM2446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13842. Retinoblastoma Binding Protein 7 (RBBP7, Accession XM_010272) is another VGAM2446 host target gene. RBBP7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

RBBP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBBP7 BINDING SITE, designated SEQ ID:30150, to the nucleotide sequence of VGAM2446 RNA, herein designated VGAM RNA, also designated SEQ ID:5157.

[82811] Another function of VGAM2446 is therefore inhibition of Retinoblastoma Binding Protein 7 (RBBP7, Accession XM_010272). Accordingly, utilities of VGAM2446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP7. LOC219654 (Accession XM_166095) is another VGAM2446 host target gene. LOC219654 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219654 BINDING SITE, designated SEQ ID:43872, to the nucleotide sequence of VGAM2446 RNA, herein designated VGAM RNA, also designated SEQ ID:5157.

[82812] Another function of VGAM2446 is therefore inhibition of

LOC219654 (Accession XM_166095). Accordingly, utilities of VGAM2446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219654. LOC221271 (Accession XM_166307) is another VGAM2446 host target gene. LOC221271 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221271 BINDING SITE, designated SEQ ID:44126, to the nucleotide sequence of VGAM2446 RNA, herein designated VGAM RNA, also designated SEQ ID:5157.

[82813] Another function of VGAM2446 is therefore inhibition of LOC221271 (Accession XM_166307). Accordingly, utilities of VGAM2446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221271. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2447 (VGAM2447) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[82814] VGAM2447 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2447 was detected is described hereinabove with reference to Figs. 1-8.

[82815] VGAM2447 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2447 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82816] VGAM2447 gene encodes a VGAM2447 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2447 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2447 precursor RNA is designated SEQ ID:2433, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2433 is located at position 2867 relative to the genome of Mouse Cytomegalovirus 1.

[82817] VGAM2447 precursor RNA folds onto itself, forming VGAM2447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82818] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2447 folded precursor RNA into VGAM2447 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2447 RNA is designated SEQ ID:5158, and is provided hereinbelow with reference to the sequence listing part.

[82819] VGAM2447 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2447 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2447 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82820] VGAM2447 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2447 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2447 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2447 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2447 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[82821] The complementary binding of VGAM2447 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2447 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2447 host target RNA into VGAM2447 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82822] It is appreciated that VGAM2447 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2447 host target genes. The mRNA of each one of this plurality of VGAM2447 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2447 RNA, herein designated VGAM RNA, and which when bound by VGAM2447 RNA causes inhibition of translation of respective one or more VGAM2447 host target proteins.

[82823] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2447 gene, herein designated VGAM GENE, on one

or more VGAM2447 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82824] It is yet further appreciated that a function of VGAM2447 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2447 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2447 correlate with, and may be deduced from, the identity of the host target genes which VGAM2447 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82825] Nucleotide sequences of the VGAM2447 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2447 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2447 are further described hereinbelow with reference to Table 1.

[82826] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2447 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2447 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82827] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2447 gene, herein designated VGAM is inhibition of expression of VGAM2447 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2447 correlate with, and may be deduced from, the identity of the target genes which VGAM2447 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82828] EphB2 (EPHB2, Accession NM_004442) is a VGAM2447

host target gene. EPHB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPHB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB2 BINDING SITE, designated SEQ ID:10730, to the nucleotide sequence of VGAM2447 RNA, herein designated VGAM RNA, also designated SEQ ID:5158.

[82829] A function of VGAM2447 is therefore inhibition of EphB2 (EPHB2, Accession NM_004442), a gene which Eph-related receptor tyrosine kinase B2; may have a role in neurogenesis. Accordingly, utilities of VGAM2447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB2. The function of EPHB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM533.G Protein-coupled Receptor 23 (GPR23, Accession XM_018505) is another VGAM2447 host target gene. GPR23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPR23, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR23 BINDING SITE, designated SEQ ID:30364, to the nucleotide sequence of VGAM2447 RNA, herein designated VGAM RNA, also designated SEQ ID:5158.

[82830] Another function of VGAM2447 is therefore inhibition of G Protein-coupled Receptor 23 (GPR23, Accession XM_018505), a gene which is a member of the G protein-coupled receptor family. Accordingly, utilities of VGAM2447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR23. The function of GPR23 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1125.KIAA1209 (Accession XM_027307) is another VGAM2447 host target gene. KIAA1209 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1209 BINDING SITE, designated SEQ ID:30469, to the nucleotide sequence of VGAM2447 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5158.

[82831] Another function of VGAM2447 is therefore inhibition of KIAA1209 (Accession XM_027307). Accordingly, utilities of VGAM2447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1209. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2448 (VGAM2448) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82832] VGAM2448 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2448 was detected is described hereinabove with reference to Figs. 1-8.

[82833] VGAM2448 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2448 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82834] VGAM2448 gene encodes a VGAM2448 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2448 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2448 precursor RNA is designated SEQ ID:2434, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2434 is located at position 134478 relative to the genome of Mouse Cytomegalovirus 1.

[82835] VGAM2448 precursor RNA folds onto itself, forming VGAM2448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82836] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2448 folded precursor RNA into VGAM2448 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2448 RNA is designated SEQ ID:5159, and is provided hereinbelow with reference to the sequence listing part.

[82837] VGAM2448 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2448 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2448 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82838] VGAM2448 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2448 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2448 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2448 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2448 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82839] The complementary binding of VGAM2448 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2448 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2448 host target RNA into VGAM2448 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82840] It is appreciated that VGAM2448 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2448 host target genes. The mRNA of

each one of this plurality of VGAM2448 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2448 RNA, herein designated VGAM RNA, and which when bound by VGAM2448 RNA causes inhibition of translation of respective one or more VGAM2448 host target proteins.

[82841] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2448 gene, herein designated VGAM GENE, on one or more VGAM2448 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[82842] It is yet further appreciated that a function of VGAM2448 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2448 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2448 correlate with, and may be deduced from, the identity of the host target genes which VGAM2448 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82843] Nucleotide sequences of the VGAM2448 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2448 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2448 are further described hereinbelow with reference to Table 1.

[82844] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2448 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2448 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82845] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2448 gene, herein designated VGAM is inhibition of expression of VGAM2448 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2448 correlate with, and may be deduced from, the identity of the target genes which VGAM2448 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82846] Mitogen-activated Protein Kinase 4 (MAPK4, Accession NM_002747) is a VGAM2448 host target gene. MAPK4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK4 BINDING SITE, designated SEQ ID:8621, to the nucleotide sequence of VGAM2448 RNA, herein designated VGAM RNA, also designated SEQ ID:5159.

[82847] A function of VGAM2448 is therefore inhibition of Mitogen-activated Protein Kinase 4 (MAPK4, Accession NM_002747), a gene which phosphorylates microtubule-

associated protein-2 may promote entry into the cell cycle. Accordingly, utilities of VGAM2448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK4. The function of MAPK4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM655.FLJ10008 (Accession NM_017970) is another VGAM2448 host target gene. FLJ10008 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10008 BINDING SITE, designated SEQ ID:19691, to the nucleotide sequence of VGAM2448 RNA, herein designated VGAM RNA, also designated SEQ ID:5159.

[82848] Another function of VGAM2448 is therefore inhibition of FLJ10008 (Accession NM_017970). Accordingly, utilities of VGAM2448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10008. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2449 (VGAM2449) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82849] VGAM2449 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2449 was detected is described hereinabove with reference to Figs. 1-8.

[82850] VGAM2449 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2449 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82851] VGAM2449 gene encodes a VGAM2449 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2449 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2449 precursor RNA is designated SEQ ID:2435, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2435 is located at position 53100 relative to the

genome of Mouse Cytomegalovirus 1.

[82852] VGAM2449 precursor RNA folds onto itself, forming VGAM2449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82853] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2449 folded precursor RNA into VGAM2449 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2449 RNA is designated SEQ ID:5160, and is provided hereinbelow with reference to the sequence listing part.

[82854] VGAM2449 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2449 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2449 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82855] VGAM2449 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2449 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2449 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2449 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2449 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82856] The complementary binding of VGAM2449 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2449 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2449 host target RNA into VGAM2449 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82857] It is appreciated that VGAM2449 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2449 host target genes. The mRNA of each one of this plurality of VGAM2449 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2449 RNA, herein designated VGAM RNA, and which when bound by VGAM2449 RNA causes inhibition of translation of respective one or more VGAM2449 host target proteins.

[82858] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2449 gene, herein designated VGAM GENE, on one or more VGAM2449 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82859] It is yet further appreciated that a function of VGAM2449 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2449

correlate with, and may be deduced from, the identity of the host target genes which VGAM2449 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82860] Nucleotide sequences of the VGAM2449 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2449 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2449 are further described hereinbelow with reference to Table 1.

[82861] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2449 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2449 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82862] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2449 gene, herein designated VGAM is inhibition of expression of VGAM2449 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2449 correlate with, and may be deduced

from, the identity of the target genes which VGAM2449 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82863] EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838) is a VGAM2449 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41878, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also designated SEQ ID:5160.

[82864] A function of VGAM2449 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838). Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Natriuretic Peptide Receptor A/guanylate Cyclase A (atrionatriuretic peptide receptor A) (NPR1, Accession XM_113360) is another VGAM2449 host target gene. NPR1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NPR1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPR1 BINDING SITE, designated SEQ ID:42232, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also designated SEQ ID:5160.

[82865] Another function of VGAM2449 is therefore inhibition of Natriuretic Peptide Receptor A/guanylate Cyclase A (atrionatriuretic peptide receptor A) (NPR1, Accession XM_113360), a gene which has guanylate cyclase activity on binding of anf. Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPR1. The function of NPR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM719.Zinc Finger Protein 80 (pT17) (ZNF80, Accession NM_007136) is another VGAM2449 host target gene. ZNF80 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF80, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

ZNF80 BINDING SITE, designated SEQ ID:13985, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also designated SEQ ID:5160.

[82866] Another function of VGAM2449 is therefore inhibition of Zinc Finger Protein 80 (pT17) (ZNF80, Accession NM_007136). Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF80. 13CDNA73 (Accession NM_023037) is another VGAM2449 host target gene. 13CDNA73 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by 13CDNA73, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of 13CDNA73 BINDING SITE, designated SEQ ID:23320, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also designated SEQ ID:5160.

[82867] Another function of VGAM2449 is therefore inhibition of 13CDNA73 (Accession NM_023037). Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with 13CDNA73. Artemin (ARTN, Accession NM_003976) is an-

other VGAM2449 host target gene. ARTN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARTN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARTN BINDING SITE, designated SEQ ID:10109, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also designated SEQ ID:5160.

[82868] Another function of VGAM2449 is therefore inhibition of Artemin (ARTN, Accession NM_003976). Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARTN. Chromobox Homolog 6 (CBX6, Accession NM_014292) is another VGAM2449 host target gene. CBX6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CBX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBX6 BINDING SITE, designated SEQ ID:15573, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also designated SEQ ID:5160.

[82869] Another function of VGAM2449 is therefore inhibition of Chromobox Homolog 6 (CBX6, Accession NM_014292). Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX6. GNB4 (Accession NM_021629) is another VGAM2449 host target gene. GNB4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNB4 BINDING SITE, designated SEQ ID:22268, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also designated SEQ ID:5160.

[82870] Another function of VGAM2449 is therefore inhibition of GNB4 (Accession NM_021629). Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB4. MAD, Mothers Against Decapentaplegic Homolog (Drosophila) Interacting Protein, Receptor Activation Anchor (MADHIP, Accession NM_007324) is another VGAM2449 host target gene. MADHIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by MADHIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADHIP BINDING SITE, designated SEQ ID:14242, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also designated SEQ ID:5160.

[82871] Another function of VGAM2449 is therefore inhibition of MAD, Mothers Against Decapentaplegic Homolog (Drosophila) Interacting Protein, Receptor Activation Anchor (MADHIP, Accession NM_007324). Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADHIP. Splicing Factor, Arginine/serine-rich 12 (SFRS12, Accession NM_139168) is another VGAM2449 host target gene. SFRS12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFRS12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS12 BINDING SITE, designated SEQ ID:29174, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5160.

[82872] Another function of VGAM2449 is therefore inhibition of Splicing Factor, Arginine/serine-rich 12 (SFRS12, Accession NM_139168). Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS12. SPEC1 (Accession NM_020239) is another VGAM2449 host target gene. SPEC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPEC1 BINDING SITE, designated SEQ ID:21508, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also designated SEQ ID:5160.

[82873] Another function of VGAM2449 is therefore inhibition of SPEC1 (Accession NM_020239). Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPEC1. Testis-specific Transcript, Y-linked 9 (TTTY9, Accession NM_031927) is another VGAM2449 host target gene. TTTY9 BINDING SITE is HOST TARGET binding site found

in the 5` untranslated region of mRNA encoded by TTTY9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTTY9 BINDING SITE, designated SEQ ID:25675, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also designated SEQ ID:5160.

[82874] Another function of VGAM2449 is therefore inhibition of Testis-specific Transcript, Y-linked 9 (TTTY9, Accession NM_031927). Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTTY9. LOC126432 (Accession XM_059046) is another VGAM2449 host target gene. LOC126432 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC126432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126432 BINDING SITE, designated SEQ ID:36839, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also designated SEQ ID:5160.

[82875] Another function of VGAM2449 is therefore inhibition of LOC126432 (Accession XM_059046). Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126432. LOC257239 (Accession XM_173125) is another VGAM2449 host target gene. LOC257239 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257239 BINDING SITE, designated SEQ ID:46373, to the nucleotide sequence of VGAM2449 RNA, herein designated VGAM RNA, also designated SEQ ID:5160.

[82876] Another function of VGAM2449 is therefore inhibition of LOC257239 (Accession XM_173125). Accordingly, utilities of VGAM2449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257239. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2450 (VGAM2450) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[82877] VGAM2450 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2450 was detected is described hereinabove with reference to Figs. 1-8.

[82878] VGAM2450 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2450 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82879] VGAM2450 gene encodes a VGAM2450 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2450 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2450 precursor RNA is designated SEQ ID:2436, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2436 is located at position 39437 relative to the genome of Mouse Cytomegalovirus 1.

[82880] VGAM2450 precursor RNA folds onto itself, forming VGAM2450 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82881] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2450 folded precursor RNA into VGAM2450 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2450 RNA is designated SEQ ID:5161, and is provided hereinbelow with reference to the sequence listing part.

[82882] VGAM2450 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2450 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2450 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82883] VGAM2450 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2450 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2450 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2450 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2450 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82884] The complementary binding of VGAM2450 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2450 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2450 host target RNA into VGAM2450 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82885] It is appreciated that VGAM2450 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2450 host target genes. The mRNA of each one of this plurality of VGAM2450 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2450 RNA, herein designated VGAM RNA, and which when bound by VGAM2450 RNA causes inhibition of translation of respective one or more VGAM2450 host target proteins.

[82886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2450 gene, herein designated VGAM GENE, on one or more VGAM2450 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82887] It is yet further appreciated that a function of VGAM2450 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2450 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2450 correlate with, and may be deduced from, the identity of the host target genes which VGAM2450 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[82888] Nucleotide sequences of the VGAM2450 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2450 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2450 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2450 are further described hereinbelow with reference to Table 1.

[82889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2450 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2450 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82890] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2450 gene, herein designated VGAM is inhibition of expression of VGAM2450 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2450 correlate with, and may be deduced from, the identity of the target genes which VGAM2450 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82891] Chromosome 20 Open Reading Frame 162 (C20orf162, Accession NM_080603) is a VGAM2450 host target gene. C20orf162 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C20orf162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf162 BINDING SITE, designated SEQ ID:27914, to the nucleotide sequence of VGAM2450 RNA, herein designated VGAM RNA, also designated SEQ ID:5161.

[82892] A function of VGAM2450 is therefore inhibition of Chromosome 20 Open Reading Frame 162 (C20orf162, Accession NM_080603). Accordingly, utilities of VGAM2450 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf162. HRIHFB2436 (Accession NM_014345) is another VGAM2450 host target gene. HRIHFB2436 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HRIHFB2436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRIHFB2436 BINDING

SITE, designated SEQ ID:15666, to the nucleotide sequence of VGAM2450 RNA, herein designated VGAM RNA, also designated SEQ ID:5161.

[82893] Another function of VGAM2450 is therefore inhibition of HRIHFB2436 (Accession NM_014345). Accordingly, utilities of VGAM2450 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRIHFB2436. LOC145988 (Accession XM_085290) is another VGAM2450 host target gene. LOC145988 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145988 BINDING SITE, designated SEQ ID:38036, to the nucleotide sequence of VGAM2450 RNA, herein designated VGAM RNA, also designated SEQ ID:5161.

[82894] Another function of VGAM2450 is therefore inhibition of LOC145988 (Accession XM_085290). Accordingly, utilities of VGAM2450 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145988. LOC220110 (Accession XM_167882) is another VGAM2450 host target gene. LOC220110 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220110 BINDING SITE, designated SEQ ID:44893, to the nucleotide sequence of VGAM2450 RNA, herein designated VGAM RNA, also designated SEQ ID:5161.

[82895] Another function of VGAM2450 is therefore inhibition of LOC220110 (Accession XM_167882). Accordingly, utilities of VGAM2450 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220110. LOC221943 (Accession XM_168343) is another VGAM2450 host target gene. LOC221943 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221943 BINDING SITE, designated SEQ ID:45116, to the nucleotide sequence of VGAM2450 RNA, herein designated VGAM RNA, also designated SEQ ID:5161.

[82896] Another function of VGAM2450 is therefore inhibition of

LOC221943 (Accession XM_168343). Accordingly, utilities of VGAM2450 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221943. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2451 (VGAM2451) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82897] VGAM2451 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2451 was detected is described hereinabove with reference to Figs. 1-8.

[82898] VGAM2451 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2451 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82899] VGAM2451 gene encodes a VGAM2451 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2451 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2451 precursor RNA is designated SEQ ID:2437, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2437 is located at position 43825 relative to the genome of Mouse Cytomegalovirus 1.

[82900] VGAM2451 precursor RNA folds onto itself, forming VGAM2451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82901] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2451 folded precursor RNA into VGAM2451 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide se-

quence of VGAM2451 RNA is designated SEQ ID:5162, and is provided hereinbelow with reference to the sequence listing part.

[82902] VGAM2451 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2451 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2451 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82903] VGAM2451 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2451 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2451 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2451 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2451 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82904] The complementary binding of VGAM2451 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2451 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2451 host target RNA into VGAM2451 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82905] It is appreciated that VGAM2451 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2451 host target genes. The mRNA of each one of this plurality of VGAM2451 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2451 RNA, herein designated VGAM RNA, and which when bound by VGAM2451 RNA causes inhibition of translation of respective one or more VGAM2451 host target proteins.

[82906] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2451 gene, herein designated VGAM GENE, on one or more VGAM2451 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82907] It is yet further appreciated that a function of VGAM2451

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2451 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2451 correlate with, and may be deduced from, the identity of the host target genes which VGAM2451 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82908] Nucleotide sequences of the VGAM2451 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2451 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2451 are further described hereinbelow with reference to Table 1.

[82909] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2451 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2451 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82910] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2451 gene, herein designated VGAM is inhibition of expression of VGAM2451 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2451 correlate with, and may be deduced from, the identity of the target genes which VGAM2451 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82911] KIAA1384 (Accession XM_035405) is a VGAM2451 host target gene. KIAA1384 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1384, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1384 BINDING SITE, designated SEQ ID:32258, to the nucleotide sequence of VGAM2451 RNA, herein designated VGAM RNA, also designated SEQ ID:5162.

[82912] A function of VGAM2451 is therefore inhibition of KIAA1384 (Accession XM_035405). Accordingly, utilities of VGAM2451 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1384. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2452 (VGAM2452) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82913] VGAM2452 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2452 was detected is described hereinabove with reference to Figs. 1-8.

[82914] VGAM2452 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2452 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82915] VGAM2452 gene encodes a VGAM2452 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2452 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2452 precursor RNA is designated SEQ ID:2438, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2438 is located at position 150242 relative to the genome of Mouse Cytomegalovirus 1.

[82916] VGAM2452 precursor RNA folds onto itself, forming VGAM2452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82917] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2452 folded precursor RNA into VGAM2452 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2452 RNA is designated SEQ ID:5163, and is provided hereinbelow with reference to the sequence listing part.

[82918] VGAM2452 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2452 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2452 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82919] VGAM2452 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2452 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2452 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2452 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2452 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82920] The complementary binding of VGAM2452 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2452 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2452 host target RNA into VGAM2452 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82921] It is appreciated that VGAM2452 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2452 host target genes. The mRNA of each one of this plurality of VGAM2452 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2452 RNA, herein designated VGAM RNA, and which when bound by VGAM2452 RNA causes inhibition of translation of respective one or more

VGAM2452 host target proteins.

[82922] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2452 gene, herein designated VGAM GENE, on one or more VGAM2452 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82923] It is yet further appreciated that a function of VGAM2452 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1.

Specific functions, and accordingly utilities, of VGAM2452 correlate with, and may be deduced from, the identity of the host target genes which VGAM2452 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82924] Nucleotide sequences of the VGAM2452 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2452 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2452 are further described hereinbelow with reference to Table 1.

[82925] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2452 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2452 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82926] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2452 gene, herein designated VGAM is inhibition of expression of VGAM2452 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2452 correlate with, and may be deduced from, the identity of the target genes which VGAM2452 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82927] Flavin Containing Monooxygenase 4 (FMO4, Accession NM_002022) is a VGAM2452 host target gene. FMO4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FMO4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMO4 BINDING SITE, designated SEQ ID:7768, to the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82928] A function of VGAM2452 is therefore inhibition of Flavin Containing Monooxygenase 4 (FMO4, Accession NM_002022). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMO4. Jerky Homolog (mouse) (JRK, Accession XM_098818) is another VGAM2452 host target gene. JRK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by JRK, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JRK BINDING SITE, designated SEQ ID:41836, to the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82929] Another function of VGAM2452 is therefore inhibition of Jerky Homolog (mouse) (JRK, Accession XM_098818), a gene which might function as a DNA-binding protein. Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JRK. The function of JRK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210.Melanoma Antigen, Family A, 3 (MAGEA3, Accession NM_005362) is another VGAM2452 host target gene. MAGEA3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAGEA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGEA3 BINDING SITE, designated SEQ ID:11839, to the nucleotide

sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82930] Another function of VGAM2452 is therefore inhibition of Melanoma Antigen, Family A, 3 (MAGEA3, Accession NM_005362), a gene which may play a role in embryonal development and tumor transformation or aspects of tumor progression. antigen recognized on a melanoma by autologous cytolytic t lymphocytes. Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGEA3. The function of MAGEA3 has been established by previous studies. Genes of the MAGE family direct the expression of tumor antigens that are recognized on a human melanoma by autologous cytolytic T lymphocytes. Family A (see OMIM Ref. No. 300016) is clustered at Xq28 and family B is clustered at Xp21.3 (see OMIM Ref. No. 300097). De Plaen et al. (1994) identified 12 family A MAGE genes. MAGE3 cDNA was cloned from a melanoma cell cDNA library. The MAGE3 gene comprises 3 exons, with the last exon containing the entire coding sequence. The gene encodes a 314-amino acid polypeptide. RT-PCR revealed that MAGE2 is expressed in a variety of cancer cell lines, but among normal tissues only in testis and

placenta. De Plaen et al. (1994) used human/rodent cell hybrids to map the MAGE family A cluster to Xq26-qter. Rogner et al. (1995) refined the mapping of the MAGE family A cluster to Xq28. The 12 genes are arranged in 3 clusters within 3.5 Mb.

[82931] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[82932] De Plaen, E.; Arden, K.; Traversari, C.; Gaforio, J. J.; Szikora, J.-P.; De Smet, C.; Brasseur, F.; van der Bruggen, P.; Lethe, B.; Lurquin, C.; Brasseur, R.; Chomez, P.; De Backer, O.; Cavenee, W.; Boon, T. : Structure, chromosomal localization, and expression of 12 genes of the MAGE family. Immunogenetics 40: 360-369, 1994. ; and

[82933] Rogner, U. C.; Wilke, K.; Steck, E.; Korn, B.; Poustka, A. : The melanoma antigen gene (MAGE) family is clustered in the chromosomal band Xq28. Genomics 29: 725-731, 1995.

[82934] Further studies establishing the function and utilities of MAGEA3 are found in John Hopkins OMIM database record ID 300174, and in sited publications numbered 7228-7229 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence.Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM_032385) is another VGAM2452 host target gene. C5orf4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C5orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE, designated SEQ ID:26185, to the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82935] Another function of VGAM2452 is therefore inhibition of Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM_032385). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4. Cleavage and Polyadenylation Specific Factor 2, 100kDa (CPSF2, Accession XM_029311) is another VGAM2452 host target gene. CPSF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CPSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of CPSF2 BINDING SITE, designated SEQ ID:30864, to the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82936] Another function of VGAM2452 is therefore inhibition of Cleavage and Polyadenylation Specific Factor 2, 100kDa (CPSF2, Accession XM_029311). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF2. KIAA1024 (Accession XM_044580) is another VGAM2452 host target gene. KIAA1024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1024 BINDING SITE, designated SEQ ID:34234, to the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82937] Another function of VGAM2452 is therefore inhibition of KIAA1024 (Accession XM_044580). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1024. MAGE-E1 (Accession NM_030801) is another VGAM2452 host target gene. MAGE-E1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAGE-E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGE-E1 BINDING SITE, designated SEQ ID:25106, to the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82938] Another function of VGAM2452 is therefore inhibition of MAGE-E1 (Accession NM_030801). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGE-E1. LOC128259 (Accession XM_059228) is another VGAM2452 host target gene. LOC128259 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC128259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128259 BINDING SITE, designated SEQ ID:36920, to the nucleotide sequence of VGAM2452 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5163.

[82939] Another function of VGAM2452 is therefore inhibition of LOC128259 (Accession XM_059228). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128259. LOC155036 (Accession XM_098651) is another VGAM2452 host target gene. LOC155036 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC155036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155036 BINDING SITE, designated SEQ ID:41752, to the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82940] Another function of VGAM2452 is therefore inhibition of LOC155036 (Accession XM_098651). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155036. LOC158510 (Accession XM_088592) is another VGAM2452 host target gene. LOC158510 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158510, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158510 BINDING SITE, designated SEQ ID:39858, to the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82941] Another function of VGAM2452 is therefore inhibition of LOC158510 (Accession XM_088592). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158510. LOC199991 (Accession XM_117169) is another VGAM2452 host target gene. LOC199991 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199991, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199991 BINDING SITE, designated SEQ ID:43275, to the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82942] Another function of VGAM2452 is therefore inhibition of LOC199991 (Accession XM_117169). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC199991. LOC201229 (Accession XM_113925) is another VGAM2452 host target gene. LOC201229 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201229 BINDING SITE, designated SEQ ID:42541, to the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82943] Another function of VGAM2452 is therefore inhibition of LOC201229 (Accession XM_113925). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201229. LOC222681 (Accession XM_167116) is another VGAM2452 host target gene. LOC222681 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222681 BINDING SITE, designated SEQ ID:44617, to

the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82944] Another function of VGAM2452 is therefore inhibition of LOC222681 (Accession XM_167116). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222681. LOC257507 (Accession XM_175204) is another VGAM2452 host target gene. LOC257507 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257507 BINDING SITE, designated SEQ ID:46683, to the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82945] Another function of VGAM2452 is therefore inhibition of LOC257507 (Accession XM_175204). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257507. LOC257625 (Accession XM_175267) is another VGAM2452 host target gene. LOC257625 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC257625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257625 BINDING SITE, designated SEQ ID:46739, to the nucleotide sequence of VGAM2452 RNA, herein designated VGAM RNA, also designated SEQ ID:5163.

[82946] Another function of VGAM2452 is therefore inhibition of LOC257625 (Accession XM_175267). Accordingly, utilities of VGAM2452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257625. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2453 (VGAM2453) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82947] VGAM2453 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2453 was detected is described hereinabove with reference to Figs. 1-8.

[82948] VGAM2453 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2453 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[82949] VGAM2453 gene encodes a VGAM2453 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2453 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2453 precursor RNA is designated SEQ ID:2439, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2439 is located at position 45147 relative to the genome of Mouse Cytomegalovirus 1.

[82950] VGAM2453 precursor RNA folds onto itself, forming VGAM2453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82951] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2453 folded precursor RNA into VGAM2453 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2453 RNA is designated SEQ ID:5164, and is provided hereinbelow with reference to the sequence listing part.

[82952] VGAM2453 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2453 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2453 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82953] VGAM2453 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2453 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2453 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2453 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2453 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82954] The complementary binding of VGAM2453 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2453 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2453

host target RNA into VGAM2453 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82955] It is appreciated that VGAM2453 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2453 host target genes. The mRNA of each one of this plurality of VGAM2453 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2453 RNA, herein designated VGAM RNA, and which when bound by VGAM2453 RNA causes inhibition of translation of respective one or more VGAM2453 host target proteins.

[82956] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2453 gene, herein designated VGAM GENE, on one or more VGAM2453 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82957] It is yet further appreciated that a function of VGAM2453 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2453 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2453 correlate with, and may be deduced from, the identity of the host target genes which VGAM2453 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82958] Nucleotide sequences of the VGAM2453 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2453 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2453 are further

described hereinbelow with reference to Table 1.

[82959] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2453 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2453 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82960] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2453 gene, herein designated VGAM is inhibition of expression of VGAM2453 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2453 correlate with, and may be deduced from, the identity of the target genes which VGAM2453 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82961] Chromosome 20 Open Reading Frame 44 (C20orf44, Accession NM_018244) is a VGAM2453 host target gene. C20orf44 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of C20orf44 BINDING SITE, designated SEQ ID:20208, to the nucleotide sequence of VGAM2453 RNA, herein designated VGAM RNA, also designated SEQ ID:5164.

[82962] A function of VGAM2453 is therefore inhibition of Chromosome 20 Open Reading Frame 44 (C20orf44, Accession NM_018244). Accordingly, utilities of VGAM2453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf44. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2454 (VGAM2454) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[82963] VGAM2454 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2454 was detected is described hereinabove with reference to Figs. 1-8.

[82964] VGAM2454 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2454 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[82965] VGAM2454 gene encodes a VGAM2454 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2454 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2454 precursor RNA is designated SEQ ID:2440, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2440 is located at position 170592 relative to the genome of Mouse Cytomegalovirus 1.

[82966] VGAM2454 precursor RNA folds onto itself, forming VGAM2454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[82967] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2454 folded precursor RNA into VGAM2454 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2454 RNA is designated SEQ ID:5165, and is provided hereinbelow with reference to the sequence listing part.

[82968] VGAM2454 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2454 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2454 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[82969] VGAM2454 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2454 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2454 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2454 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2454 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[82970] The complementary binding of VGAM2454 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2454 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2454 host target RNA into VGAM2454 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[82971] It is appreciated that VGAM2454 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2454 host target genes. The mRNA of each one of this plurality of VGAM2454 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2454 RNA, herein designated VGAM RNA, and which when bound by VGAM2454 RNA causes inhibition of translation of respective one or more VGAM2454 host target proteins.

[82972] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2454 gene, herein designated VGAM GENE, on one or more VGAM2454 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[82973] It is yet further appreciated that a function of VGAM2454 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2454 correlate with, and may be deduced from, the identity of the host target genes which VGAM2454 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[82974] Nucleotide sequences of the VGAM2454 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2454 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2454 are further described hereinbelow with reference to Table 1.

[82975] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2454 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2454 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[82976] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2454 gene, herein designated VGAM is inhibition of expression of VGAM2454 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2454 correlate with, and may be deduced from, the identity of the target genes which VGAM2454 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[82977] Actinin, Alpha 2 (ACTN2, Accession NM_001103) is a VGAM2454 host target gene. ACTN2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ACTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTN2 BINDING SITE, designated SEQ ID:6756, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[82978] A function of VGAM2454 is therefore inhibition of Actinin, Alpha 2 (ACTN2, Accession NM_001103), a gene which an actin-binding protein with multiple roles in different cell types. Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTN2. The function of ACTN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM88.Rho Guanine Nucleotide Exchange Factor (GEF) 7 (ARHGEF7, Accession NM_003899) is another VGAM2454 host target gene. ARHGEF7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHGEF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF7 BINDING SITE, designated SEQ ID:9985, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[82979] Another function of VGAM2454 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 7 (ARHGEF7, Accession NM_003899), a gene which acts as a

rac1 guanine nucleotide exchange factor (gef) and can induce membrane ruffling. Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF7. The function of ARHGEF7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM297.Brain-specific Angiogenesis Inhibitor 2 (BAI2, Accession NM_001703) is another VGAM2454 host target gene. BAI2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BAI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAI2 BINDING SITE, designated SEQ ID:7426, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[82980] Another function of VGAM2454 is therefore inhibition of Brain-specific Angiogenesis Inhibitor 2 (BAI2, Accession NM_001703). Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAI2. Core-binding Factor,

Runt Domain, Alpha Subunit 2; Translocated To, 3 (CBFA2T3, Accession NM_005187) is another VGAM2454 host target gene. CBFA2T3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CBFA2T3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T3 BINDING SITE, designated SEQ ID:11687, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[82981] Another function of VGAM2454 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 3 (CBFA2T3, Accession NM_005187). Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T3. Filamin A, Alpha (actin binding protein 280) (FLNA, Accession NM_001456) is another VGAM2454 host target gene. FLNA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLNA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of FLNA BINDING SITE, designated SEQ ID:7192, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[82982] Another function of VGAM2454 is therefore inhibition of Filamin A, Alpha (actin binding protein 280) (FLNA, Accession NM_001456), a gene which promotes orthogonal branching of actin filaments and links actin filaments to membrane glycoproteins. Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLNA. The function of FLNA has been established by previous studies. Actin-binding protein, or filamin, is a 280-kD protein that crosslinks actin filaments into orthogonal networks in cortical cytoplasm and participates in the anchoring of membrane proteins for the actin cytoskeleton. By analysis of the native ABP protein and cloning of the human endothelial ABP cDNA, Gorlin et al. (1990) demonstrated that ABP is a 2,647-amino acid protein with 3 functional domains: an N-terminal filamentous actin-binding domain, a C-terminal self-association domain, and a membrane glycoprotein-binding domain. The N-terminal actin-binding domain of ABP280 displays strong

structural and functional similarity to the N-terminal domains of dystrophin (OMIM Ref. No. 300377), alpha-actinin (OMIM Ref. No. 102575), and beta-spectrin (OMIM Ref. No. 182870). Periventricular heterotopia (OMIM Ref. No. 300049) is an X-linked dominant disorder in which many neurons fail to migrate to the cerebral cortex and persist as nodules lining the ventricular surface. Heterozygous females with the disorder present with epilepsy and other signs, including patent ductus arteriosus and coagulopathy, whereas hemizygous affected males die embryonically. Fox et al. (1998) identified the cause as mutations in the FLN1 gene, which is required for locomotion of many cell types. They demonstrated a previously unrecognized high level of expression of FLN1 in the developing cortex. Their studies demonstrated that FLN1 is required for neuronal migration to the cortex and is essential for embryogenesis. In identifying filamin-1 as the gene mutant in periventricular heterotopia, Fox et al. (1998) first narrowed the map location to an interval approximately 1 cM between marker DXS15 and the pseudoautosomal region of Xq28 by the study of additional markers. Subsequent analysis of a large duplication of Xq28 in a male patient with periventricular heterotopia

(Fink et al., 1997) with a severe, albeit nonlethal, phenotype allowed the candidate interval to be refined even further. They defined the exact centromeric boundary of the duplicated segment of Xq28 as base 3377 of 3,395 bases in intron 1 of the isocitrate dehydrogenase gene (IDH3G; 300089), approximately 600 kb distal to DXS15. However, none of the genes identified at the breakpoints or insertion site of the duplication harbored independent mutations in other patients with periventricular heterotopia. Therefore, Fox et al. (1998) concluded that the duplication itself was responsible for the disorder in this patient. Fox et al. (1998) studied the pattern of X inactivation in females with FLN1 mutations in nucleated peripheral blood cells. No evidence of preferential lyonization in these cells was found, suggesting that FLN1 is not required in a cell-autonomous fashion for survival of mixed peripheral white blood cells. However, an essential cell-autonomous role for FLN1 in a subset of nucleated cells or nonnucleated cells (e.g., platelets) could not be excluded. Sheen et al. (2001) performed SSCP analysis of FLN1 throughout its entire coding region in 6 periventricular heterotopia pedigrees, 31 sporadic female patients, and 24 sporadic male periventricular heterotopia patients. The authors detected

FLN1 mutations in 83% of periventricular heterotopia pedigrees and 19% of sporadic females with periventricular heterotopia. Moreover, 0 of 7 females with periventricular heterotopia with atypical radiographic features showed FLN1 mutations, suggesting that other genes may cause atypical periventricular heterotopia. Two of 24 males analyzed with periventricular heterotopia (9%) also carried FLN1 mutations. Whereas FLN1 mutations in periventricular heterotopia pedigrees caused severe predicted loss of FLN1 protein function, both male FLN1 mutations were consistent with partial loss of function of the protein. Moreover, sporadic female FLN1 mutations associated with periventricular heterotopia appear to cause either severe or partial loss of function. In the largest reported pedigree with periventricular heterotopia (OMIM Ref. No. 300049) (Huttenlocher et al., 1994), Fox et al. (1998) found a C-to-T substitution in exon 3 of the FLN1 gene, which converted a CAG (gln) to a TAG (stop) codon and truncated the FLN1 protein at amino acid residue 182 of the 2,647 total amino acids in the normal protein.

[82983] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[82984] Sheen, V. L.; Dixon, P. H.; Fox, J. W.; Hong, S. E.; Kinton, L.; Sisodiya, S. M.; Duncan, J. S.; Dubeau, F.; Scheffer, I. E.; Schachter, S. C.; Wilner, A.; Henchy, R.; and 18 others : Mutations in the X-linked filamin 1 gene cause periventricular nodular heterotopia in males as well as in females. Hum. Molec. Genet. 10: 1775-1783, 2001. ; and

[82985] Fox, J. W.; Lamperti, E. D.; Eksioglu, Y. Z.; Hong, S. E.; Feng, Y.; Graham, D. A.; Scheffer, I. E.; Dobyns, W. B.; Hirsch, B. A.; Radtke, R. A.; Berkovic, S. F.; Huttenlocher, P. R.; W.

[82986] Further studies establishing the function and utilities of FLNA are found in John Hopkins OMIM database record ID 300017, and in sited publications numbered 7230-7233, 7255-726 and 9435-7264 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog (avian) (MAF, Accession NM_005360) is another VGAM2454 host target gene. MAF BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAF BINDING

SITE, designated SEQ ID:11836, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[82987] Another function of VGAM2454 is therefore inhibition of V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog (avian) (MAF, Accession NM_005360), a gene which is a transcription factor; contains a leucine zipper motif. Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAF. The function of MAF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM822.MYC-associated Zinc Finger Protein (purine-binding transcription factor) (MAZ, Accession XM_055771) is another VGAM2454 host target gene. MAZ BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAZ BINDING SITE, designated SEQ ID:36324, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ

ID:5165.

[82988] Another function of VGAM2454 is therefore inhibition of MYC-associated Zinc Finger Protein (purine-binding transcription factor) (MAZ, Accession XM_055771). Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAZ. Regulating Synaptic Membrane Exocytosis 1 (RIMS1, Accession XM_052206) is another VGAM2454 host target gene. RIMS1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RIMS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIMS1 BINDING SITE, designated SEQ ID:35956, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[82989] Another function of VGAM2454 is therefore inhibition of Regulating Synaptic Membrane Exocytosis 1 (RIMS1, Accession XM_052206), a gene which may have a regulatory role in the membrane interactions during trafficking of synaptic vesicles. Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with RIMS1. The function of RIMS1 has been established by previous studies. Coppola et al. (2001) obtained 6 isoforms of human RIM that differ from each other in the distance between their 2 C2 domains. Binding analysis showed that the C2 domains of RIM interact in a calcium-independent manner with N-type calcium channels. They also interact weakly with SNAP25 (OMIM Ref. No. 600322) and strongly with synaptotagmin-1 (SYT1; 185605). In the presence of calcium, the interaction with SYT1 increases and that with SNAP25 decreases. Coppola et al. (2001) concluded that RIM1 is a scaffold protein that interacts with multiple binding partners and coordinates different stages of the secretory process. Animal model experiments lend further support to the function of RIMS1. Long-term potentiation (LTP) is involved in learning and memory. One form of LTP requires activation of postsynaptic NMDA receptors (e.g., GRIN2B; 138252), while the other form, mossy fiber LTP (mfLTP), occurs in the presynaptic areas and requires Rab3a and activation of protein kinase A (PKA; OMIM Ref. No. 176911). RIM1 is a PKA substrate. Castillo et al. (2002) showed that in Rim1-deficient mice, mfLTP was abolished in the hippocampus and cerebellum. They lo-

calized the expression of mfLTP to the interface between synaptic vesicles and the active zone and showed that the vesicle protein Rab3a and the active zone protein Rim1 are required.

[82990] It is appreciated that the abovementioned animal model for RIMS1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[82991] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[82992] Coppola, T.; Magnin-Luthi, S.; Perret-Menoud, V.; Gattesco, S.; Schiavo, G.; Regazzi, R. : Direct interaction of the Rab3 effector RIM with Ca(2+) channels, SNAP-25, and synaptotagmin. J. Biol. Chem. 276: 32756-32762, 2001. ; and

[82993] Castillo, P. E.; Schoch, S.; Schmitz, F.; Sudhof, T. C.; Malenka, R. C. : RIM1-alpha is required for presynaptic long-term potentiation. Nature 415: 327-330, 2002.

[82994] Further studies establishing the function and utilities of RIMS1 are found in John Hopkins OMIM database record ID 606629, and in sited publications numbered 6113-6115, 95 and 6116-6117 listed in the bibliography section

hereinbelow, which are also hereby incorporated by reference.Complexin 1 (CPLX1, Accession NM_006651) is another VGAM2454 host target gene. CPLX1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CPLX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPLX1 BINDING SITE, designated SEQ ID:13448, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[82995] Another function of VGAM2454 is therefore inhibition of Complexin 1 (CPLX1, Accession NM_006651). Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPLX1. GC20 (Accession XM_044184) is another VGAM2454 host target gene. GC20 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GC20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GC20 BINDING SITE, designated SEQ ID:34167, to the nucleotide sequence of

VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[82996] Another function of VGAM2454 is therefore inhibition of GC20 (Accession XM_044184). Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GC20. MGC14386 (Accession NM_033544) is another VGAM2454 host target gene. MGC14386 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC14386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14386 BINDING SITE, designated SEQ ID:27306, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[82997] Another function of VGAM2454 is therefore inhibition of MGC14386 (Accession NM_033544). Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14386. PRO1048 (Accession NM_018497) is another VGAM2454 host target gene. PRO1048 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by PRO1048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1048 BINDING SITE, designated SEQ ID:20563, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[82998] Another function of VGAM2454 is therefore inhibition of PRO1048 (Accession NM_018497). Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1048. Regulator of G-protein Signalling 19 (RGS19, Accession NM_005873) is another VGAM2454 host target gene. RGS19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RGS19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS19 BINDING SITE, designated SEQ ID:12491, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[82999] Another function of VGAM2454 is therefore inhibition of

Regulator of G-protein Signalling 19 (RGS19, Accession NM_005873). Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS19. SCYD1 (Accession XM_165650) is another VGAM2454 host target gene. SCYD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCYD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYD1 BINDING SITE, designated SEQ ID:43709, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[83000] Another function of VGAM2454 is therefore inhibition of SCYD1 (Accession XM_165650). Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYD1. LOC128977 (Accession XM_059313) is another VGAM2454 host target gene. LOC128977 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC128977, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128977 BINDING SITE, designated SEQ ID:36949, to the nucleotide sequence of VGAM2454 RNA, herein designated VGAM RNA, also designated SEQ ID:5165.

[83001] Another function of VGAM2454 is therefore inhibition of LOC128977 (Accession XM_059313). Accordingly, utilities of VGAM2454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128977. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2455 (VGAM2455) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83002] VGAM2455 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2455 was detected is described hereinabove with reference to Figs. 1-8.

[83003] VGAM2455 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2455 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[83004] VGAM2455 gene encodes a VGAM2455 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2455 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2455 precursor RNA is designated SEQ ID:2441, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2441 is located at position 3102 relative to the genome of Mouse Cytomegalovirus 1.

[83005] VGAM2455 precursor RNA folds onto itself, forming VGAM2455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83006] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2455 folded precursor RNA into VGAM2455

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2455 RNA is designated SEQ ID:5166, and is provided hereinbelow with reference to the sequence listing part.

[83007] VGAM2455 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2455 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2455 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83008] VGAM2455 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2455 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2455 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2455 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2455 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83009] The complementary binding of VGAM2455 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2455 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2455 host target RNA into VGAM2455 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[83010] It is appreciated that VGAM2455 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2455 host target genes. The mRNA of each one of this plurality of VGAM2455 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2455 RNA, herein designated VGAM RNA, and which when bound by VGAM2455 RNA causes inhibition of translation of respective one or more VGAM2455 host target proteins.

[83011] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2455 gene, herein designated VGAM GENE, on one or more VGAM2455 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83012] It is yet further appreciated that a function of VGAM2455 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2455 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2455 correlate with, and may be deduced from, the identity of the host target genes which VGAM2455 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83013] Nucleotide sequences of the VGAM2455 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2455 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2455 are further described hereinbelow with reference to Table 1.

[83014] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2455 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2455 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83015] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2455 gene, herein designated VGAM is inhibition of expression of VGAM2455 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2455 correlate with, and may be deduced from, the identity of the target genes which VGAM2455 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83016] DKFZP434J214 (Accession XM_027639) is a VGAM2455 host target gene. DKFZP434J214 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434J214, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J214 BINDING SITE, designated SEQ ID:30549, to the nucleotide sequence of VGAM2455 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5166.

[83017] A function of VGAM2455 is therefore inhibition of DKFZP434J214 (Accession XM_027639). Accordingly, utilities of VGAM2455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J214. KIAA1708 (Accession XM_040211) is another VGAM2455 host target gene. KIAA1708 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1708, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1708 BINDING SITE, designated SEQ ID:33274, to the nucleotide sequence of VGAM2455 RNA, herein designated VGAM RNA, also designated SEQ ID:5166.

[83018] Another function of VGAM2455 is therefore inhibition of KIAA1708 (Accession XM_040211). Accordingly, utilities of VGAM2455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1708. MGC20235 (Accession NM_145041) is another VGAM2455 host target gene. MGC20235 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC20235, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20235 BINDING SITE, designated SEQ ID:29669, to the nucleotide sequence of VGAM2455 RNA, herein designated VGAM RNA, also designated SEQ ID:5166.

[83019] Another function of VGAM2455 is therefore inhibition of MGC20235 (Accession NM_145041). Accordingly, utilities of VGAM2455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20235. LOC147949 (Accession XM_085973) is another VGAM2455 host target gene. LOC147949 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147949, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147949 BINDING SITE, designated SEQ ID:38423, to the nucleotide sequence of VGAM2455 RNA, herein designated VGAM RNA, also designated SEQ ID:5166.

[83020] Another function of VGAM2455 is therefore inhibition of LOC147949 (Accession XM_085973). Accordingly, utilities of VGAM2455 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC147949. LOC147990 (Accession XM_097358) is another VGAM2455 host target gene. LOC147990 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147990 BINDING SITE, designated SEQ ID:40864, to the nucleotide sequence of VGAM2455 RNA, herein designated VGAM RNA, also designated SEQ ID:5166.

[83021] Another function of VGAM2455 is therefore inhibition of LOC147990 (Accession XM_097358). Accordingly, utilities of VGAM2455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147990. LOC163115 (Accession XM_092010) is another VGAM2455 host target gene. LOC163115 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC163115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163115 BINDING SITE, designated SEQ ID:40089, to

the nucleotide sequence of VGAM2455 RNA, herein designated VGAM RNA, also designated SEQ ID:5166.

[83022] Another function of VGAM2455 is therefore inhibition of LOC163115 (Accession XM_092010). Accordingly, utilities of VGAM2455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163115. LOC92697 (Accession XM_046715) is another VGAM2455 host target gene. LOC92697 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92697 BINDING SITE, designated SEQ ID:34799, to the nucleotide sequence of VGAM2455 RNA, herein designated VGAM RNA, also designated SEQ ID:5166.

[83023] Another function of VGAM2455 is therefore inhibition of LOC92697 (Accession XM_046715). Accordingly, utilities of VGAM2455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92697. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2456 (VGAM2456) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83024] VGAM2456 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2456 was detected is described hereinabove with reference to Figs. 1-8.

[83025] VGAM2456 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2456 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83026] VGAM2456 gene encodes a VGAM2456 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2456 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2456 precursor RNA is designated SEQ ID:2442, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2442 is located at position 166990 relative to the genome of Mouse Cytomegalovirus 1.

[83027] VGAM2456 precursor RNA folds onto itself, forming VGAM2456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83028] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2456 folded precursor RNA into VGAM2456 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2456 RNA is designated SEQ ID:5167, and is provided hereinbelow with reference to the sequence listing part.

[83029] VGAM2456 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2456 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2456 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83030] VGAM2456 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2456 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2456 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2456 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2456 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83031] The complementary binding of VGAM2456 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2456 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2456 host target RNA into VGAM2456 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83032] It is appreciated that VGAM2456 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2456 host target genes. The mRNA of each one of this plurality of VGAM2456 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2456 RNA, herein designated VGAM RNA, and which when bound by VGAM2456 RNA causes inhibition of translation of respective one or more VGAM2456 host target proteins.

[83033] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2456 gene, herein designated VGAM GENE, on one or more VGAM2456 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83034] It is yet further appreciated that a function of VGAM2456 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2456 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2456 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2456 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83035] Nucleotide sequences of the VGAM2456 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2456 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2456 are further described hereinbelow with reference to Table 1.

[83036] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2456 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2456 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83037] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2456 gene, herein designated VGAM is inhibition of expression of VGAM2456 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2456 correlate with, and may be deduced from, the identity of the target genes which VGAM2456

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83038] Caspase Recruitment Domain Family, Member 4 (CARD4, Accession NM_006092) is a VGAM2456 host target gene. CARD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CARD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD4 BINDING SITE, designated SEQ ID:12739, to the nucleotide sequence of VGAM2456 RNA, herein designated VGAM RNA, also designated SEQ ID:5167.

[83039] A function of VGAM2456 is therefore inhibition of Caspase Recruitment Domain Family, Member 4 (CARD4, Accession NM_006092), a gene which Activates CASP9 to induce apoptosis, regulates activation of NF-kappaB. Accordingly, utilities of VGAM2456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD4. The function of CARD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM492.Fig. 1 further pro-

vides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2457 (VGAM2457) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83040] VGAM2457 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2457 was detected is described hereinabove with reference to Figs. 1-8.

[83041] VGAM2457 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2457 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83042] VGAM2457 gene encodes a VGAM2457 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2457 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2457 precursor RNA is designated SEQ ID:2443, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2443 is located at position 49086 relative to the genome of Mouse Cytomegalovirus 1.

[83043] VGAM2457 precursor RNA folds onto itself, forming VGAM2457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83044] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2457 folded precursor RNA into VGAM2457 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2457 RNA is designated SEQ ID:5168, and is provided hereinbelow with reference to the sequence listing part.

[83045] VGAM2457 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2457 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2457 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83046] VGAM2457 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2457 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2457 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2457 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2457 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83047] The complementary binding of VGAM2457 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2457 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2457 host target RNA into VGAM2457 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83048] It is appreciated that VGAM2457 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2457 host target genes. The mRNA of each one of this plurality of VGAM2457 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2457 RNA, herein designated VGAM RNA, and which when bound by VGAM2457 RNA causes inhibition of translation of respective one or more

VGAM2457 host target proteins.

[83049] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2457 gene, herein designated VGAM GENE, on one or more VGAM2457 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83050] It is yet further appreciated that a function of VGAM2457 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1.

Specific functions, and accordingly utilities, of VGAM2457 correlate with, and may be deduced from, the identity of the host target genes which VGAM2457 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83051] Nucleotide sequences of the VGAM2457 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2457 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2457 are further described hereinbelow with reference to Table 1.

[83052] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2457 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2457 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83053] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2457 gene, herein designated VGAM is inhibition of expression of VGAM2457 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2457 correlate with, and may be deduced from, the identity of the target genes which VGAM2457 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83054] APM1 (Accession NM_004797) is a VGAM2457 host target gene. APM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE, designated SEQ ID:11210, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83055] A function of VGAM2457 is therefore inhibition of APM1 (Accession NM_004797). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1. ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916) is another VGAM2457 host target gene. ATP8A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP8A2, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8A2 BINDING SITE, designated SEQ ID:44913, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83056] Another function of VGAM2457 is therefore inhibition of ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8A2. Chromosome 14 Open Reading Frame 1 (C14orf1, Accession NM_007176) is another VGAM2457 host target gene. C14orf1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C14orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C14orf1 BINDING SITE, designated SEQ ID:14029, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83057] Another function of VGAM2457 is therefore inhibition of Chromosome 14 Open Reading Frame 1 (C14orf1, Acces-

sion NM_007176). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf1. EphA8 (EPHA8, Accession NM_020526) is another VGAM2457 host target gene. EPHA8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA8 BINDING SITE, designated SEQ ID:21741, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83058] Another function of VGAM2457 is therefore inhibition of EphA8 (EPHA8, Accession NM_020526), a gene which Eph-related receptor tyrosine kinase A8. Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA8. The function of EPHA8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM494.Ellis Van Creveld Syndrome (EVC, Accession NM_014556) is another VGAM2457 host

target gene. EVC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EVC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVC BINDING SITE, designated SEQ ID:15884, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83059] Another function of VGAM2457 is therefore inhibition of Ellis Van Creveld Syndrome (EVC, Accession NM_014556). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC. Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725) is another VGAM2457 host target gene. FANCF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FANCF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCF BINDING SITE, designated SEQ ID:22923, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5168.

[83060] Another function of VGAM2457 is therefore inhibition of Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCF. IMP (inosine monophosphate) Dehydrogenase 1 (IMPDH1, Accession NM_000883) is another VGAM2457 host target gene. IMPDH1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IMPDH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPDH1 BINDING SITE, designated SEQ ID:6579, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83061] Another function of VGAM2457 is therefore inhibition of IMP (inosine monophosphate) Dehydrogenase 1 (IMPDH1, Accession NM_000883). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPDH1. Tripartite Motif-containing 9 (TRIM9, Accession

NM_015163) is another VGAM2457 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:17517, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83062] Another function of VGAM2457 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM_015163), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked. oligosaccharides. Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Ankyrin Repeat and SOCS Box-containing 16 (ASB16, Accession

XM_046024) is another VGAM2457 host target gene. ASB16 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ASB16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASB16 BINDING SITE, designated SEQ ID:34653, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83063] Another function of VGAM2457 is therefore inhibition of Ankyrin Repeat and SOCS Box-containing 16 (ASB16, Accession XM_046024). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB16. FLJ20897 (Accession NM_032378) is another VGAM2457 host target gene. FLJ20897 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20897, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20897 BINDING SITE, designated SEQ ID:26173, to the nucleotide sequence of VGAM2457

RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83064] Another function of VGAM2457 is therefore inhibition of FLJ20897 (Accession NM_032378). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20897. KIAA0441 (Accession NM_014797) is another VGAM2457 host target gene. KIAA0441 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0441 BINDING SITE, designated SEQ ID:16710, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83065] Another function of VGAM2457 is therefore inhibition of KIAA0441 (Accession NM_014797). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0441. MGC14697 (Accession NM_032747) is another VGAM2457 host target gene. MGC14697 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by MGC14697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14697 BINDING SITE, designated SEQ ID:26484, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83066] Another function of VGAM2457 is therefore inhibition of MGC14697 (Accession NM_032747). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14697. Sideroflexin 2 (SFXN2, Accession XM_058359) is another VGAM2457 host target gene. SFXN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFXN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFXN2 BINDING SITE, designated SEQ ID:36603, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83067] Another function of VGAM2457 is therefore inhibition of Sideroflexin 2 (SFXN2, Accession XM_058359). Accord-

ingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFXN2. SKRP1 (Accession NM_080876) is another VGAM2457 host target gene. SKRP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SKRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKRP1 BINDING SITE, designated SEQ ID:28120, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83068] Another function of VGAM2457 is therefore inhibition of SKRP1 (Accession NM_080876). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKRP1. Syntaxin 4A (placental) (STX4A, Accession NM_004604) is another VGAM2457 host target gene. STX4A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by STX4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX4A BIND-

ING SITE, designated SEQ ID:10947, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83069] Another function of VGAM2457 is therefore inhibition of Syntaxin 4A (placental) (STX4A, Accession NM_004604). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX4A. Vacuolar Protein Sorting 4A (yeast) (VPS4A, Accession NM_013245) is another VGAM2457 host target gene. VPS4A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VPS4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS4A BINDING SITE, designated SEQ ID:14906, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83070] Another function of VGAM2457 is therefore inhibition of Vacuolar Protein Sorting 4A (yeast) (VPS4A, Accession NM_013245). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS4A. LOC160646

(Accession XM_090413) is another VGAM2457 host target gene. LOC160646 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC160646, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160646 BINDING SITE, designated SEQ ID:40002, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83071] Another function of VGAM2457 is therefore inhibition of LOC160646 (Accession XM_090413). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160646. LOC221296 (Accession XM_166325) is another VGAM2457 host target gene. LOC221296 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221296 BINDING SITE, designated SEQ ID:44169, to the nucleotide sequence of VGAM2457 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5168.

[83072] Another function of VGAM2457 is therefore inhibition of LOC221296 (Accession XM_166325). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221296. LOC255308 (Accession XM_170536) is another VGAM2457 host target gene. LOC255308 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255308 BINDING SITE, designated SEQ ID:45355, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83073] Another function of VGAM2457 is therefore inhibition of LOC255308 (Accession XM_170536). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255308. LOC56963 (Accession XM_049372) is another VGAM2457 host target gene. LOC56963 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC56963, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56963 BINDING SITE, designated SEQ ID:35399, to the nucleotide sequence of VGAM2457 RNA, herein designated VGAM RNA, also designated SEQ ID:5168.

[83074] Another function of VGAM2457 is therefore inhibition of LOC56963 (Accession XM_049372). Accordingly, utilities of VGAM2457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56963. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2458 (VGAM2458) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83075] VGAM2458 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2458 was detected is described hereinabove with reference to Figs. 1-8.

[83076] VGAM2458 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus

1. VGAM2458 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83077] VGAM2458 gene encodes a VGAM2458 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2458 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2458 precursor RNA is designated SEQ ID:2444, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2444 is located at position 183475 relative to the genome of Mouse Cytomegalovirus 1.

[83078] VGAM2458 precursor RNA folds onto itself, forming VGAM2458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83079] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2458 folded precursor RNA into VGAM2458 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM2458 RNA is designated SEQ ID:5169, and is provided hereinbelow with reference to the sequence listing part.

[83080] VGAM2458 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2458 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2458 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83081] VGAM2458 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2458 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2458 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2458 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2458 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83082] The complementary binding of VGAM2458 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2458 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2458 host target RNA into VGAM2458 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83083] It is appreciated that VGAM2458 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2458 host target genes. The mRNA of each one of this plurality of VGAM2458 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2458 RNA, herein designated VGAM RNA, and which when bound by VGAM2458 RNA causes inhibition of translation of respective one or more VGAM2458 host target proteins.

[83084] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2458 gene, herein designated VGAM GENE, on one or more VGAM2458 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83085] It is yet further appreciated that a function of VGAM2458 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2458 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2458 correlate with, and may be deduced from, the identity of the host target genes which VGAM2458 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83086] Nucleotide sequences of the VGAM2458 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2458 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2458 are further described hereinbelow with reference to Table 1.

[83087] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2458 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2458 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83088] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2458 gene, herein designated VGAM is inhibition of expression of VGAM2458 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2458 correlate with, and may be deduced from, the identity of the target genes which VGAM2458 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83089] Male Germ Cell-associated Kinase (MAK, Accession NM_005906) is a VGAM2458 host target gene. MAK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAK BINDING SITE, designated SEQ ID:12528, to the nucleotide

sequence of VGAM2458 RNA, herein designated VGAM RNA, also designated SEQ ID:5169.

[83090] A function of VGAM2458 is therefore inhibition of Male Germ Cell-associated Kinase (MAK, Accession NM_005906), a gene which plays an important role in spermatogenesis. Accordingly, utilities of VGAM2458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAK. The function of MAK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1322.Prominin-like 1 (mouse) (PROML1, Accession NM_006017) is another VGAM2458 host target gene. PROML1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PROML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROML1 BINDING SITE, designated SEQ ID:12636, to the nucleotide sequence of VGAM2458 RNA, herein designated VGAM RNA, also designated SEQ ID:5169.

[83091] Another function of VGAM2458 is therefore inhibition of

Prominin-like 1 (mouse) (PROML1, Accession NM_006017), a gene which is a Transmembrane protein. Accordingly, utilities of VGAM2458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROML1. The function of PROML1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM905.RAD9 Homolog (S. pombe) (RAD9, Accession NM_004584) is another VGAM2458 host target gene. RAD9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAD9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD9 BINDING SITE, designated SEQ ID:10931, to the nucleotide sequence of VGAM2458 RNA, herein designated VGAM RNA, also designated SEQ ID:5169.

[83092] Another function of VGAM2458 is therefore inhibition of RAD9 Homolog (S. pombe) (RAD9, Accession NM_004584), a gene which may function as a cell cycle checkpoint protein. Accordingly, utilities of VGAM2458 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with RAD9. The function of RAD9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.DKFZp434J0617 (Accession NM_032246) is another VGAM2458 host target gene. DKFZp434J0617 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434J0617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434J0617 BINDING SITE, designated SEQ ID:25981, to the nucleotide sequence of VGAM2458 RNA, herein designated VGAM RNA, also designated SEQ ID:5169.

[83093] Another function of VGAM2458 is therefore inhibition of DKFZp434J0617 (Accession NM_032246). Accordingly, utilities of VGAM2458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434J0617. HT012 (Accession NM_018473) is another VGAM2458 host target gene. HT012 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HT012, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT012 BINDING SITE, designated SEQ ID:20540, to the nucleotide sequence of VGAM2458 RNA, herein designated VGAM RNA, also designated SEQ ID:5169.

[83094] Another function of VGAM2458 is therefore inhibition of HT012 (Accession NM_018473). Accordingly, utilities of VGAM2458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT012. KIAA0945 (Accession NM_014952) is another VGAM2458 host target gene. KIAA0945 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0945 BINDING SITE, designated SEQ ID:17288, to the nucleotide sequence of VGAM2458 RNA, herein designated VGAM RNA, also designated SEQ ID:5169.

[83095] Another function of VGAM2458 is therefore inhibition of KIAA0945 (Accession NM_014952). Accordingly, utilities of VGAM2458 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0945. Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065) is another VGAM2458 host target gene. SIRPB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIRPB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRPB1 BINDING SITE, designated SEQ ID:12707, to the nucleotide sequence of VGAM2458 RNA, herein designated VGAM RNA, also designated SEQ ID:5169.

[83096] Another function of VGAM2458 is therefore inhibition of Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065). Accordingly, utilities of VGAM2458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRPB1. LOC154834 (Accession XM_098621) is another VGAM2458 host target gene. LOC154834 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154834, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC154834 BINDING SITE, designated SEQ ID:41731, to the nucleotide sequence of VGAM2458 RNA, herein designated VGAM RNA, also designated SEQ ID:5169.

[83097] Another function of VGAM2458 is therefore inhibition of LOC154834 (Accession XM_098621). Accordingly, utilities of VGAM2458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154834. LOC51094 (Accession NM_015999) is another VGAM2458 host target gene. LOC51094 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51094, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51094 BINDING SITE, designated SEQ ID:18089, to the nucleotide sequence of VGAM2458 RNA, herein designated VGAM RNA, also designated SEQ ID:5169.

[83098] Another function of VGAM2458 is therefore inhibition of LOC51094 (Accession NM_015999). Accordingly, utilities of VGAM2458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51094. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2459 (VGAM2459) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83099] VGAM2459 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2459 was detected is described hereinabove with reference to Figs. 1-8.

[83100] VGAM2459 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2459 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83101] VGAM2459 gene encodes a VGAM2459 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2459 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2459 precursor RNA is designated SEQ ID:2445, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2445 is located at position 121309 relative to the genome of Mouse Cytomegalovirus 1.

[83102] VGAM2459 precursor RNA folds onto itself, forming VGAM2459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83103] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2459 folded precursor RNA into VGAM2459 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2459 RNA is designated SEQ ID:5170, and is provided hereinbelow with reference to the sequence listing part.

[83104] VGAM2459 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2459 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2459 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83105] VGAM2459 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2459 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2459 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2459 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2459 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83106] The complementary binding of VGAM2459 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2459 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2459 host target RNA into VGAM2459 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83107] It is appreciated that VGAM2459 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2459 host target genes. The mRNA of each one of this plurality of VGAM2459 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2459 RNA, herein designated VGAM RNA, and which when bound by VGAM2459 RNA causes inhibition of translation of respective one or more

VGAM2459 host target proteins.

[83108] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2459 gene, herein designated VGAM GENE, on one or more VGAM2459 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83109] It is yet further appreciated that a function of VGAM2459 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1.

Specific functions, and accordingly utilities, of VGAM2459 correlate with, and may be deduced from, the identity of the host target genes which VGAM2459 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83110] Nucleotide sequences of the VGAM2459 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2459 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2459 are further described hereinbelow with reference to Table 1.

[83111] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2459 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2459 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83112] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2459 gene, herein designated VGAM is inhibition of expression of VGAM2459 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2459 correlate with, and may be deduced from, the identity of the target genes which VGAM2459 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83113] Gamma-glutamyltransferase 2 (GGT2, Accession XM_057166) is a VGAM2459 host target gene. GGT2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GGT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGT2 BINDING SITE, designated SEQ ID:36489, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83114] A function of VGAM2459 is therefore inhibition of Gamma-glutamyltransferase 2 (GGT2, Accession XM_057166). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGT2. Interleukin-1 Receptor-associated Kinase 4 (IRAK4, Accession XM_028349) is another VGAM2459 host target gene. IRAK4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IRAK4, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRAK4 BINDING SITE, designated SEQ ID:30692, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83115] Another function of VGAM2459 is therefore inhibition of Interleukin-1 Receptor-associated Kinase 4 (IRAK4, Accession XM_028349), a gene which may function as an IRAK1 kinase, triggering a cascade of phosphorylation events. Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRAK4. The function of IRAK4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1291.Potassium Intermediate/small Conductance Calcium-activated Channel, Subfamily N, Member 4 (KCNN4, Accession NM_002250) is another VGAM2459 host target gene. KCNN4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNN4 BINDING SITE, designated SEQ ID:8038, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83116] Another function of VGAM2459 is therefore inhibition of Potassium Intermediate/small Conductance Calcium-activated Channel, Subfamily N, Member 4 (KCNN4, Accession NM_002250), a gene which forms a voltage-independent potassium channel that is activated by intracellular calcium. Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNN4. The function of KCNN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.Paired Box Gene 7 (PAX7, Accession NM_002584) is another VGAM2459 host target gene. PAX7 BINDING SITE1 and PAX7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PAX7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PAX7 BINDING SITE1 and PAX7 BINDING SITE2, designated SEQ ID:8446 and SEQ ID:15134 respectively, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83117] Another function of VGAM2459 is therefore inhibition of Paired Box Gene 7 (PAX7, Accession NM_002584), a gene which involves in myogenesis. Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX7. The function of PAX7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM304.Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 1 (RPS6KA1, Accession XM_001416) is another VGAM2459 host target gene. RPS6KA1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RPS6KA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA1 BINDING SITE, designated SEQ ID:29836, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM

RNA, also designated SEQ ID:5170.

[83118] Another function of VGAM2459 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 1 (RPS6KA1, Accession XM_001416). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA1. ARS2 (Accession NM_015908) is another VGAM2459 host target gene. ARS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARS2 BINDING SITE, designated SEQ ID:18045, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83119] Another function of VGAM2459 is therefore inhibition of ARS2 (Accession NM_015908). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARS2. Cerebellin 1 Precursor (CBLN1, Accession NM_004352) is another VGAM2459 host target gene. CBLN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by CBLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBLN1 BINDING SITE, designated SEQ ID:10557, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83120] Another function of VGAM2459 is therefore inhibition of Cerebellin 1 Precursor (CBLN1, Accession NM_004352). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBLN1. DKFZP566F2124 (Accession NM_015630) is another VGAM2459 host target gene. DKFZP566F2124 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP566F2124, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566F2124 BINDING SITE, designated SEQ ID:17887, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83121] Another function of VGAM2459 is therefore inhibition of

DKFZP566F2124 (Accession NM_015630). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566F2124. FLJ11712 (Accession NM_024570) is another VGAM2459 host target gene. FLJ11712 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11712 BINDING SITE, designated SEQ ID:23796, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83122] Another function of VGAM2459 is therefore inhibition of FLJ11712 (Accession NM_024570). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11712. FLJ32468 (Accession NM_145115) is another VGAM2459 host target gene. FLJ32468 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ32468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ32468 BINDING SITE, designated SEQ ID:29721, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83123] Another function of VGAM2459 is therefore inhibition of FLJ32468 (Accession NM_145115). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32468. KIAA0469 (Accession NM_014851) is another VGAM2459 host target gene. KIAA0469 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:16893, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83124] Another function of VGAM2459 is therefore inhibition of KIAA0469 (Accession NM_014851). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469. KIAA0662 (Accession XM_088539) is another

VGAM2459 host target gene. KIAA0662 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0662 BINDING SITE, designated SEQ ID:39803, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83125] Another function of VGAM2459 is therefore inhibition of KIAA0662 (Accession XM_088539). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0662. KIAA1530 (Accession XM_042661) is another VGAM2459 host target gene. KIAA1530 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1530, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:33733, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83126] Another function of VGAM2459 is therefore inhibition of KIAA1530 (Accession XM_042661). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530. LOC161635 (Accession XM_172921) is another VGAM2459 host target gene. LOC161635 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC161635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161635 BINDING SITE, designated SEQ ID:46184, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83127] Another function of VGAM2459 is therefore inhibition of LOC161635 (Accession XM_172921). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161635. LOC254057 (Accession XM_173085) is another VGAM2459 host target gene. LOC254057 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254057, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254057 BINDING SITE, designated SEQ ID:46347, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83128] Another function of VGAM2459 is therefore inhibition of LOC254057 (Accession XM_173085). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254057. LOC83693 (Accession NM_031463) is another VGAM2459 host target gene. LOC83693 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC83693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC83693 BINDING SITE, designated SEQ ID:25495, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83129] Another function of VGAM2459 is therefore inhibition of LOC83693 (Accession NM_031463). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC83693. LOC90288 (Accession XM_030669) is another VGAM2459 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31105, to the nucleotide sequence of VGAM2459 RNA, herein designated VGAM RNA, also designated SEQ ID:5170.

[83130] Another function of VGAM2459 is therefore inhibition of LOC90288 (Accession XM_030669). Accordingly, utilities of VGAM2459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2460 (VGAM2460) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83131] VGAM2460 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2460 was detected is described hereinabove with reference to Figs. 1-8.

[83132] VGAM2460 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2460 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83133] VGAM2460 gene encodes a VGAM2460 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2460 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2460 precursor RNA is designated SEQ ID:2446, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2446 is located at position 17895 relative to the genome of Mouse Cytomegalovirus 1.

[83134] VGAM2460 precursor RNA folds onto itself, forming VGAM2460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83135] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2460 folded precursor RNA into VGAM2460 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2460 RNA is designated SEQ ID:5171, and is provided hereinbelow with reference to the sequence listing part.

[83136] VGAM2460 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2460 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2460 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83137] VGAM2460 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2460 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2460 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2460 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2460 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83138] The complementary binding of VGAM2460 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2460 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2460 host target RNA into VGAM2460 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83139] It is appreciated that VGAM2460 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2460 host target genes. The mRNA of each one of this plurality of VGAM2460 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2460 RNA, herein designated VGAM RNA, and which when bound by VGAM2460 RNA causes inhibition of translation of respective one or more VGAM2460 host target proteins.

[83140] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2460 gene, herein designated VGAM GENE, on one or more VGAM2460 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83141] It is yet further appreciated that a function of VGAM2460 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2460 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2460 correlate with, and may be deduced from, the identity of the host target genes which VGAM2460 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83142] Nucleotide sequences of the VGAM2460 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2460 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2460 are further described hereinbelow with reference to Table 1.

[83143] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2460 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2460 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83144] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2460 gene, herein designated VGAM is inhibition of expression of VGAM2460 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2460 correlate with, and may be deduced from, the identity of the target genes which VGAM2460 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83145] CAP350 (Accession NM_014810) is a VGAM2460 host target gene. CAP350 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CAP350, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAP350 BINDING SITE, designated SEQ ID:16771, to the nucleotide sequence of VGAM2460 RNA, herein designated VGAM RNA, also designated SEQ ID:5171.

[83146] A function of VGAM2460 is therefore inhibition of CAP350 (Accession NM_014810). Accordingly, utilities of VGAM2460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAP350. KIAA0350 (Accession XM_028332) is another VGAM2460 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30663, to the nucleotide sequence of VGAM2460 RNA, herein designated VGAM RNA, also designated SEQ ID:5171.

[83147] Another function of VGAM2460 is therefore inhibition of KIAA0350 (Accession XM_028332). Accordingly, utilities of VGAM2460 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0350. KIAA1944 (Accession XM_062545) is another VGAM2460 host target gene. KIAA1944 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1944 BINDING SITE, designated SEQ ID:37229, to the nucleotide sequence of VGAM2460 RNA, herein designated VGAM RNA, also designated SEQ ID:5171.

[83148] Another function of VGAM2460 is therefore inhibition of KIAA1944 (Accession XM_062545). Accordingly, utilities of VGAM2460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1944. LOC152579 (Accession XM_087489) is another VGAM2460 host target gene. LOC152579 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152579 BINDING SITE, designated SEQ ID:39290, to

the nucleotide sequence of VGAM2460 RNA, herein designated VGAM RNA, also designated SEQ ID:5171.

[83149] Another function of VGAM2460 is therefore inhibition of LOC152579 (Accession XM_087489). Accordingly, utilities of VGAM2460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152579. LOC158654 (Accession XM_088632) is another VGAM2460 host target gene. LOC158654 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158654 BINDING SITE, designated SEQ ID:39876, to the nucleotide sequence of VGAM2460 RNA, herein designated VGAM RNA, also designated SEQ ID:5171.

[83150] Another function of VGAM2460 is therefore inhibition of LOC158654 (Accession XM_088632). Accordingly, utilities of VGAM2460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158654. LOC200448 (Accession XM_114234) is another VGAM2460 host target gene. LOC200448 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC200448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200448 BINDING SITE, designated SEQ ID:42816, to the nucleotide sequence of VGAM2460 RNA, herein designated VGAM RNA, also designated SEQ ID:5171.

[83151] Another function of VGAM2460 is therefore inhibition of LOC200448 (Accession XM_114234). Accordingly, utilities of VGAM2460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200448. LOC222166 (Accession XM_168425) is another VGAM2460 host target gene. LOC222166 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222166 BINDING SITE, designated SEQ ID:45150, to the nucleotide sequence of VGAM2460 RNA, herein designated VGAM RNA, also designated SEQ ID:5171.

[83152] Another function of VGAM2460 is therefore inhibition of LOC222166 (Accession XM_168425). Accordingly, utilities

of VGAM2460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222166. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2461 (VGAM2461) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83153] VGAM2461 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2461 was detected is described hereinabove with reference to Figs. 1-8.

[83154] VGAM2461 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2461 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83155] VGAM2461 gene encodes a VGAM2461 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2461 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2461 precursor RNA is designated SEQ ID:2447, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2447 is located at position 219567 relative to the genome of Mouse Cytomegalovirus 1.

[83156] VGAM2461 precursor RNA folds onto itself, forming VGAM2461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83157] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2461 folded precursor RNA into VGAM2461 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2461 RNA is designated SEQ ID:5172, and

is provided hereinbelow with reference to the sequence listing part.

[83158] VGAM2461 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2461 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2461 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83159] VGAM2461 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2461 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2461 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2461 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2461 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83160] The complementary binding of VGAM2461 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2461 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2461 host target RNA into VGAM2461 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83161] It is appreciated that VGAM2461 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2461 host target genes. The mRNA of each one of this plurality of VGAM2461 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2461 RNA, herein designated VGAM RNA, and which when bound by VGAM2461 RNA causes inhibition of translation of respective one or more VGAM2461 host target proteins.

[83162] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2461 gene, herein designated VGAM GENE, on one or more VGAM2461 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83163] It is yet further appreciated that a function of VGAM2461 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2461 correlate with, and may be deduced from, the identity of the host target genes which VGAM2461 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83164] Nucleotide sequences of the VGAM2461 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2461 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2461 are further described hereinbelow with reference to Table 1.

[83165] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2461 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2461 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83166] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2461 gene, herein designated VGAM is inhibition of expression of VGAM2461 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2461 correlate with, and may be deduced from, the identity of the target genes which VGAM2461 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83167] Cyclin-dependent Kinase 2 (CDK2, Accession NM_001798) is a VGAM2461 host target gene. CDK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK2 BINDING SITE, designated SEQ ID:7552, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83168] A function of VGAM2461 is therefore inhibition of Cyclin-dependent Kinase 2 (CDK2, Accession NM_001798), a gene which plays a unique role in cell cycle regulation of vertebrate cells. Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK2. The function of

CDK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1467.Cytochrome P450, Subfamily VIIIB (sterol 12-alpha-hydroxylase), Polypeptide 1 (CYP8B1, Accession NM_004391) is another VGAM2461 host target gene. CYP8B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP8B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP8B1 BINDING SITE, designated SEQ ID:10625, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83169] Another function of VGAM2461 is therefore inhibition of Cytochrome P450, Subfamily VIIIB (sterol 12-alpha-hydroxylase), Polypeptide 1 (CYP8B1, Accession NM_004391), a gene which functions in bile acid biosynthesis. Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP8B1. The function of CYP8B1 and its association with various diseases and clin-

ical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923.High-mobility Group Nucleosomal Binding Domain 2 (HMGN2, Accession NM_005517) is another VGAM2461 host target gene. HMGN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMGN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGN2 BINDING SITE, designated SEQ ID:12040, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83170] Another function of VGAM2461 is therefore inhibition of High-mobility Group Nucleosomal Binding Domain 2 (HMGN2, Accession NM_005517), a gene which binds HMG proteins and may confer specific conformations to transcriptionally active regions of chromatin. Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGN2. The function of HMGN2 has been established by previous studies. Chromosomal proteins HMG-17 and HMG-14 are among the most abundant, ubiqui-

tous, and evolutionarily conserved nonhistone proteins found in the nuclei of higher eukaryotes. The large number of retropseudogenes are scattered over several chromosomes. Landsman and Bustin (1986) showed that the nonhistone chromosomal proteins HMG-14 (OMIM Ref. No. 163920) and HMG-17 are encoded by distinct genes, each of which is part of a separate multigene family. These families may have evolved independently from similar genetic elements or from a shared ancestral gene in which the nucleotide sequence coding for the DNA-binding domain of the protein is the most conserved region. The structural differences between the molecules and the differences in their DNA-binding domains suggest that the proteins may be involved in distinguishable cellular functions. They may confer specific conformations to transcriptionally active regions of chromatin. (HMG stands for 'high mobility group.') Landsman and Bustin (1986) and Landsman et al. (1986) isolated and sequenced full-length cDNAs for human HMG-14 and HMG-17. The sequences indicate that these are both functional genes. Porkka et al. (2002) reported a cDNA that encodes a fragment of HMG17 (referred to as HMGN2 by them), a highly conserved nucleosomal protein thought to be involved in

unfolding higher-order chromatin structure and facilitating the transcriptional activation of mammalian genes (Bustin, 1999). Porkka et al. (2002) derived a 31-amino acid synthetic peptide from this HMG17 fragment which, when injected intravenously, accumulates in the nuclei of tumor endothelial cells and tumor cells, carrying a payload to a tumor and into the cell nuclei in the tumor. They suggested that the peptide may be suitable for targeting cytotoxic drugs and gene therapy vectors into tumors.

[83171] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83172] Landsman, D.; Bustin, M. : Chromosomal proteins HMG-14 and HMG-17: distinct multigene families coding for similar types of transcripts. J. Biol. Chem. 261: 16087-16091, 1986. ; and

[83173] Porkka, K.; Laakkonen, P.; Hoffman, J. A.; Bernasconi, M.; Ruoslahti, E. : A fragment of the HMGN2 protein homes to the nuclei of tumor cells and tumor endothelial cells in vivo. Proc. N.

[83174] Further studies establishing the function and utilities of HMGN2 are found in John Hopkins OMIM database record ID 163910, and in sited publications numbered

3011-3018 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.RAD1 Homolog (S. pombe) (RAD1, Accession NM_133377) is another VGAM2461 host target gene. RAD1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD1 BINDING SITE, designated SEQ ID:28500, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83175] Another function of VGAM2461 is therefore inhibition of RAD1 Homolog (S. pombe) (RAD1, Accession NM_133377), a gene which has important roles in DNA damage-activated mitotic and meiotic cell cycle checkpoints. Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD1. The function of RAD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM922.RNA (guanine-7-) Methyltransferase (RNMT, Accession

NM_003799) is another VGAM2461 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:9888, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83176] Another function of VGAM2461 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession NM_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.WW45 (Accession NM_021818) is another VGAM2461 host target gene. WW45 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WW45, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WW45 BINDING SITE, designated SEQ ID:22397, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83177] Another function of VGAM2461 is therefore inhibition of WW45 (Accession NM_021818), a gene which is required for ubiquitination and therefore degradation of several cell surface proteins like gap1, fur4, mal61 and ste2. also acts on rbp1. Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WW45. The function of WW45 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1646.CXYorf1 (Accession XM_088704) is another VGAM2461 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39910, to the nucleotide

sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83178] Another function of VGAM2461 is therefore inhibition of CXYorf1 (Accession XM_088704). Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXY-orf1. KIAA1393 (Accession XM_050793) is another VGAM2461 host target gene. KIAA1393 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1393 BINDING SITE, designated SEQ ID:35684, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83179] Another function of VGAM2461 is therefore inhibition of KIAA1393 (Accession XM_050793). Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1393. PRO0902 (Accession NM_053057) is another VGAM2461 host target gene. PRO0902 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by PRO0902, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0902 BINDING SITE, designated SEQ ID:27606, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83180] Another function of VGAM2461 is therefore inhibition of PRO0902 (Accession NM_053057). Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0902. TU3A (Accession NM_007177) is another VGAM2461 host target gene. TU3A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TU3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU3A BINDING SITE, designated SEQ ID:14034, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83181] Another function of VGAM2461 is therefore inhibition of TU3A (Accession NM_007177). Accordingly, utilities of

VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU3A. LOC152267 (Accession XM_017070) is another VGAM2461 host target gene. LOC152267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152267 BINDING SITE, designated SEQ ID:30294, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83182] Another function of VGAM2461 is therefore inhibition of LOC152267 (Accession XM_017070). Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152267. LOC200093 (Accession XM_032184) is another VGAM2461 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC200093 BINDING SITE, designated SEQ ID:31602, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83183] Another function of VGAM2461 is therefore inhibition of LOC200093 (Accession XM_032184). Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC204084 (Accession XM_115181) is another VGAM2461 host target gene. LOC204084 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC204084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204084 BINDING SITE, designated SEQ ID:43086, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83184] Another function of VGAM2461 is therefore inhibition of LOC204084 (Accession XM_115181). Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204084. LOC221463 (Accession XM_166374) is another VGAM2461 host target gene. LOC221463 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221463 BINDING SITE, designated SEQ ID:44202, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83185] Another function of VGAM2461 is therefore inhibition of LOC221463 (Accession XM_166374). Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221463. LOC91040 (Accession XM_035641) is another VGAM2461 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:32319, to the nucleotide sequence of VGAM2461 RNA, herein designated VGAM RNA, also designated SEQ ID:5172.

[83186] Another function of VGAM2461 is therefore inhibition of

LOC91040 (Accession XM_035641). Accordingly, utilities of VGAM2461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2462 (VGAM2462) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83187] VGAM2462 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2462 was detected is described hereinabove with reference to Figs. 1-8.

[83188] VGAM2462 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2462 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83189] VGAM2462 gene encodes a VGAM2462 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2462 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2462 precursor RNA is designated SEQ ID:2448, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2448 is located at position 164 relative to the genome of Mouse Cytomegalovirus 1.

[83190] VGAM2462 precursor RNA folds onto itself, forming VGAM2462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83191] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2462 folded precursor RNA into VGAM2462 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide se-

quence of VGAM2462 RNA is designated SEQ ID:5173, and is provided hereinbelow with reference to the sequence listing part.

[83192] VGAM2462 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2462 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2462 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83193] VGAM2462 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2462 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2462 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2462 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2462 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83194] The complementary binding of VGAM2462 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2462 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2462 host target RNA into VGAM2462 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83195] It is appreciated that VGAM2462 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2462 host target genes. The mRNA of each one of this plurality of VGAM2462 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2462 RNA, herein designated VGAM RNA, and which when bound by VGAM2462 RNA causes inhibition of translation of respective one or more VGAM2462 host target proteins.

[83196] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2462 gene, herein designated VGAM GENE, on one or more VGAM2462 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83197] It is yet further appreciated that a function of VGAM2462

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2462 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2462 correlate with, and may be deduced from, the identity of the host target genes which VGAM2462 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83198] Nucleotide sequences of the VGAM2462 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2462 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2462 are further described hereinbelow with reference to Table 1.

[83199] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2462 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2462 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83200] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2462 gene, herein designated VGAM is inhibition of expression of VGAM2462 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2462 correlate with, and may be deduced from, the identity of the target genes which VGAM2462 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83201] CARPX (Accession NM_020178) is a VGAM2462 host target gene. CARPX BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CARPX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARPX BINDING SITE, designated SEQ ID:21397, to the nucleotide sequence of VGAM2462 RNA, herein designated VGAM RNA, also designated SEQ ID:5173.

[83202] A function of VGAM2462 is therefore inhibition of CARPX (Accession NM_020178), a gene which is alpha-carbonic anhydrases-related protein. Accordingly, utilities of VGAM2462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARPX.

The function of CARPX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM904.Neural Retina Leucine Zipper (NRL, Accession NM_006177) is another VGAM2462 host target gene. NRL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRL BINDING SITE, designated SEQ ID:12837, to the nucleotide sequence of VGAM2462 RNA, herein designated VGAM RNA, also designated SEQ ID:5173.

[83203] Another function of VGAM2462 is therefore inhibition of Neural Retina Leucine Zipper (NRL, Accession NM_006177), a gene which has a basic motif and a leucine zipper domain similar to jun and fos. Accordingly, utilities of VGAM2462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRL. The function of NRL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419.Retinoic Acid Receptor, Beta (RARB, Acces-

sion NM_016152) is another VGAM2462 host target gene. RARB BINDING SITE1 and RARB BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RARB, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RARB BINDING SITE1 and RARB BINDING SITE2, designated SEQ ID:18235 and SEQ ID:6691 respectively, to the nucleotide sequence of VGAM2462 RNA, herein designated VGAM RNA, also designated SEQ ID:5173.

[83204] Another function of VGAM2462 is therefore inhibition of Retinoic Acid Receptor, Beta (RARB, Accession NM_016152), a gene which is one member of the steroid/thyroid hormone receptor family of ligand-activated transcription factors. Accordingly, utilities of VGAM2462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RARB. The function of RARB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179.TEM7 (Accession NM_020405) is another VGAM2462 host target gene. TEM7 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by TEM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM7 BINDING SITE, designated SEQ ID:21673, to the nucleotide sequence of VGAM2462 RNA, herein designated VGAM RNA, also designated SEQ ID:5173.

[83205] Another function of VGAM2462 is therefore inhibition of TEM7 (Accession NM_020405), a gene which involves in angiogenesis. Accordingly, utilities of VGAM2462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM7. The function of TEM7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM23.KIAA1340 (Accession XM_044836) is another VGAM2462 host target gene. KIAA1340 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1340 BINDING SITE, designated SEQ ID:34299, to the

nucleotide sequence of VGAM2462 RNA, herein designated VGAM RNA, also designated SEQ ID:5173.

[83206] Another function of VGAM2462 is therefore inhibition of KIAA1340 (Accession XM_044836). Accordingly, utilities of VGAM2462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1340. PRO1331 (Accession NM_030778) is another VGAM2462 host target gene. PRO1331 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1331, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1331 BINDING SITE, designated SEQ ID:25066, to the nucleotide sequence of VGAM2462 RNA, herein designated VGAM RNA, also designated SEQ ID:5173.

[83207] Another function of VGAM2462 is therefore inhibition of PRO1331 (Accession NM_030778). Accordingly, utilities of VGAM2462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1331. LOC201696 (Accession XM_032269) is another VGAM2462 host target gene. LOC201696 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC201696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201696 BINDING SITE, designated SEQ ID:31625, to the nucleotide sequence of VGAM2462 RNA, herein designated VGAM RNA, also designated SEQ ID:5173.

[83208] Another function of VGAM2462 is therefore inhibition of LOC201696 (Accession XM_032269). Accordingly, utilities of VGAM2462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201696. LOC221092 (Accession XM_167749) is another VGAM2462 host target gene. LOC221092 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221092 BINDING SITE, designated SEQ ID:44774, to the nucleotide sequence of VGAM2462 RNA, herein designated VGAM RNA, also designated SEQ ID:5173.

[83209] Another function of VGAM2462 is therefore inhibition of LOC221092 (Accession XM_167749). Accordingly, utilities

of VGAM2462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221092. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2463 (VGAM2463) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83210] VGAM2463 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2463 was detected is described hereinabove with reference to Figs. 1-8.

[83211] VGAM2463 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2463 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83212] VGAM2463 gene encodes a VGAM2463 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2463 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2463 precursor RNA is designated SEQ ID:2449, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2449 is located at position 225478 relative to the genome of Mouse Cytomegalovirus 1.

[83213] VGAM2463 precursor RNA folds onto itself, forming VGAM2463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83214] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2463 folded precursor RNA into VGAM2463 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2463 RNA is designated SEQ ID:5174, and

is provided hereinbelow with reference to the sequence listing part.

[83215] VGAM2463 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2463 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2463 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83216] VGAM2463 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2463 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2463 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2463 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2463 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83217] The complementary binding of VGAM2463 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2463 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2463 host target RNA into VGAM2463 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83218] It is appreciated that VGAM2463 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2463 host target genes. The mRNA of each one of this plurality of VGAM2463 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2463 RNA, herein designated VGAM RNA, and which when bound by VGAM2463 RNA causes inhibition of translation of respective one or more VGAM2463 host target proteins.

[83219] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2463 gene, herein designated VGAM GENE, on one or more VGAM2463 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83220] It is yet further appreciated that a function of VGAM2463 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2463 correlate with, and may be deduced from, the identity of the host target genes which VGAM2463 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83221] Nucleotide sequences of the VGAM2463 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2463 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2463 are further described hereinbelow with reference to Table 1.

[83222] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2463 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2463 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83223] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2463 gene, herein designated VGAM is inhibition of expression of VGAM2463 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2463 correlate with, and may be deduced from, the identity of the target genes which VGAM2463 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83224] Active BCR-related Gene (ABR, Accession NM_001092) is a VGAM2463 host target gene. ABR BINDING SITE1 and ABR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABR BINDING SITE1 and ABR BINDING SITE2, designated SEQ ID:6750 and SEQ ID:22495 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83225] A function of VGAM2463 is therefore inhibition of Active BCR-related Gene (ABR, Accession NM_001092), a gene which gtpase-activating protein for rac and cdc42. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with ABR. The function of ABR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM489.ADP-ribosylation Factor 3 (ARF3, Accession NM_001659) is another VGAM2463 host target gene. ARF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF3 BINDING SITE, designated SEQ ID:7379, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83226] Another function of VGAM2463 is therefore inhibition of ADP-ribosylation Factor 3 (ARF3, Accession NM_001659). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF3. Asialoglycoprotein Receptor 2 (ASGR2, Accession NM_001181) is another VGAM2463 host target gene. ASGR2 BINDING SITE1 through ASGR2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ASGR2, corre-

sponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASGR2 BINDING SITE1 through ASGR2 BINDING SITE3, designated SEQ ID:6852, SEQ ID:28132 and SEQ ID:28131 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83227] Another function of VGAM2463 is therefore inhibition of Asialoglycoprotein Receptor 2 (ASGR2, Accession NM_001181). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASGR2. B-cell CLL/lymphoma 9 (BCL9, Accession NM_004326) is another VGAM2463 host target gene. BCL9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL9 BINDING SITE, designated SEQ ID:10523, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83228] Another function of VGAM2463 is therefore inhibition of B-cell CLL/lymphoma 9 (BCL9, Accession NM_004326), a gene which recruits of PYGO to the nuclear beta-catenin-TCF complex in Wnt/Wingless signaling. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL9. The function of BCL9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.BRIP1 (Accession NM_032043) is another VGAM2463 host target gene. BRIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRIP1 BINDING SITE, designated SEQ ID:25755, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83229] Another function of VGAM2463 is therefore inhibition of BRIP1 (Accession NM_032043). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRIP1.

Calcium Channel, Voltage-dependent, Gamma Subunit 7 (CACNG7, Accession NM_031896) is another VGAM2463 host target gene. CACNG7 BINDING SITE1 and CACNG7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CACNG7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNG7 BINDING SITE1 and CACNG7 BINDING SITE2, designated SEQ ID:25639 and SEQ ID:25640 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83230] Another function of VGAM2463 is therefore inhibition of Calcium Channel, Voltage-dependent, Gamma Subunit 7 (CACNG7, Accession NM_031896), a gene which may stabilize the calcium channel in an inactivated (closed) state. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG7. The function of CACNG7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2228.Cholinergic Receptor, Nicotinic, Alpha

Polypeptide 5 (CHRNA5, Accession XM_007577) is another VGAM2463 host target gene. CHRNA5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CHRNA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRNA5 BINDING SITE, designated SEQ ID:30058, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83231] Another function of VGAM2463 is therefore inhibition of Cholinergic Receptor, Nicotinic, Alpha Polypeptide 5 (CHRNA5, Accession XM_007577). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRNA5. Cholinergic Receptor, Nicotinic, Beta Polypeptide 1 (muscle) (CHRNB1, Accession XM_018451) is another VGAM2463 host target gene. CHRNB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHRNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRNB1

BINDING SITE, designated SEQ ID:30359, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83232] Another function of VGAM2463 is therefore inhibition of Cholinergic Receptor, Nicotinic, Beta Polypeptide 1 (muscle) (CHRNB1, Accession XM_018451). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRNB1. Ceroid-lipofuscinosis, Neuronal 6, Late Infantile, Variant (CLN6, Accession NM_017882) is another VGAM2463 host target gene. CLN6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLN6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN6 BINDING SITE, designated SEQ ID:19550, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83233] Another function of VGAM2463 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 6, Late Infantile, Variant (CLN6, Accession NM_017882). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CLN6. Collagen, Type I, Alpha 1 (COL1A1, Accession NM_000088) is another VGAM2463 host target gene. COL1A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL1A1 BINDING SITE, designated SEQ ID:5538, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83234] Another function of VGAM2463 is therefore inhibition of Collagen, Type I, Alpha 1 (COL1A1, Accession NM_000088). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL1A1. Corticotropin Releasing Hormone Receptor 2 (CRHR2, Accession NM_001883) is another VGAM2463 host target gene. CRHR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRHR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CRHR2 BINDING SITE, designated SEQ ID:7612, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83235] Another function of VGAM2463 is therefore inhibition of Corticotropin Releasing Hormone Receptor 2 (CRHR2, Accession NM_001883), a gene which is a corticotropin releasing factor receptor type II. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRHR2. The function of CRHR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM737.Cytochrome B-561 (CYB561, Accession NM_001915) is another VGAM2463 host target gene. CYB561 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CYB561, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYB561 BINDING SITE, designated SEQ ID:7630, to the nucleotide sequence of VGAM2463 RNA,

herein designated VGAM RNA, also designated SEQ ID:5174.

[83236] Another function of VGAM2463 is therefore inhibition of Cytochrome B-561 (CYB561, Accession NM_001915), a gene which is a secretory vesicle-specific electron transport protein. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYB561. The function of CYB561 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1929.Damage-specific DNA Binding Protein 1, 127kDa (DDB1, Accession NM_001923) is another VGAM2463 host target gene. DDB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDB1 BINDING SITE, designated SEQ ID:7639, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83237] Another function of VGAM2463 is therefore inhibition of

Damage-specific DNA Binding Protein 1, 127kDa (DDB1, Accession NM_001923). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDB1. Dihydrolipoamide S-succinyltransferase (E2 component of 2-oxo-glutarate complex) (DLST, Accession NM_001933) is another VGAM2463 host target gene. DLST BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLST BINDING SITE, designated SEQ ID:7643, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83238] Another function of VGAM2463 is therefore inhibition of Dihydrolipoamide S-succinyltransferase (E2 component of 2-oxo-glutarate complex) (DLST, Accession NM_001933), a gene which catalyzes the oxidative decarboxylation of alpha-keto acids. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLST. The function of DLST and its association with various diseases and clinical

conditions, has been established by previous studies, as described hereinabove with reference to VGAM656.Ectodermal Dysplasia 1, Anhidrotic (ED1, Accession NM_001399) is another VGAM2463 host target gene. ED1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ED1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ED1 BINDING SITE, designated SEQ ID:7097, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83239] Another function of VGAM2463 is therefore inhibition of Ectodermal Dysplasia 1, Anhidrotic (ED1, Accession NM_001399). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ED1. EH-domain Containing 3 (EHD3, Accession NM_014600) is another VGAM2463 host target gene. EHD3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EHD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of EHD3 BINDING SITE, designated SEQ ID:15957, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83240] Another function of VGAM2463 is therefore inhibition of EH-domain Containing 3 (EHD3, Accession NM_014600). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD3. Empty Spiracles Homolog 2 (Drosophila) (EMX2, Accession XM_113640) is another VGAM2463 host target gene. EMX2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EMX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMX2 BINDING SITE, designated SEQ ID:42316, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83241] Another function of VGAM2463 is therefore inhibition of Empty Spiracles Homolog 2 (Drosophila) (EMX2, Accession XM_113640), a gene which may function in combinations with otx1/2 to specify cell fates in the developing central

nervous system. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMX2. The function of EMX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM510.Eyes Absent Homolog 4 (Drosophila) (EYA4, Accession NM_004100) is another VGAM2463 host target gene. EYA4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EYA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EYA4 BINDING SITE, designated SEQ ID:10309, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83242] Another function of VGAM2463 is therefore inhibition of Eyes Absent Homolog 4 (Drosophila) (EYA4, Accession NM_004100), a gene which may be involved in development of the eye (by similarity). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EYA4. The function of EYA4 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM707.Fanconi Anemia, Complementation Group C (FANCC, Accession XM_047190) is another VGAM2463 host target gene. FANCC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FANCC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCC BINDING SITE, designated SEQ ID:34906, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83243] Another function of VGAM2463 is therefore inhibition of Fanconi Anemia, Complementation Group C (FANCC, Accession XM_047190). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCC. F-box and Leucine-rich Repeat Protein 4 (FBXL4, Accession NM_012160) is another VGAM2463 host target gene. FBXL4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FBXL4, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL4 BINDING SITE, designated SEQ ID:14459, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83244] Another function of VGAM2463 is therefore inhibition of F-box and Leucine-rich Repeat Protein 4 (FBXL4, Accession NM_012160), a gene which may degrade regulatory proteins by recruiting them for ubiquitin conjugating enzymes. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL4. The function of FBXL4 has been established by previous studies. The F box, named after cyclin F (CCNF; 600227), in which it was originally observed, is an approximately 40-amino acid motif that binds SKP1 (OMIM Ref. No. 601434). F-box proteins are components of modular E3 ubiquitin protein ligases called SCFs (SKP1, OMIM Ref. No. 603134), F-box proteins), which function in phosphorylation-dependent ubiquitination. Using a yeast 2-hybrid screen with SKP1 as bait, followed by searching sequence databases, Winston et al. (1999) and Cenciarelli et al. (1999) identified 33

mammalian and 26 human F-box proteins, respectively. These contained C termini with leucine-rich repeats (FBXLs, e.g., SKP2 (OMIM Ref. No. 601436)), WD40 domains (FBXWs, e.g., BTRCP (OMIM Ref. No. 603482)), or no recognizable motifs (FBXOs, e.g., CCNF). Using RT-PCR analysis, Winston et al. (1999) detected FBXL4 expression in heart, kidney, liver, lung, pancreas, and placenta, but not in skeletal muscle. Immunofluorescence microscopy demonstrated both nuclear and cytoplasmic expression. By searching sequence databases, Ilyin et al. (2000) identified a cDNA encoding FBXL4, which they referred to as FBL5. The deduced 621-amino acid protein contains at least 9 leucine-rich repeats. Based on its inclusion within a mapped clone, Ilyin et al. (2000) mapped the FBXL4 gene to 6q16.1-q16.3.

[83245] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83246] Cenciarelli, C.; Chiaur, D. S.; Guardavaccaro, D.; Parks, W.; Vidal, M.; Pagano, M. : Identification of a family of human F-box proteins. Curr. Biol. 9: 1177-1179, 1999. ; and

[83247] Ilyin, G. P.; Rialland, M.; Pigeon, C.; Guguen-Guillouzo, C. : cDNA cloning and expression analysis of new members

of the mammalian F-box protein family. Genomics 67: 40-47, 2000.

[83248] Further studies establishing the function and utilities of FBXL4 are found in John Hopkins OMIM database record ID 605654, and in sited publications numbered 40 and 8278 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Fragile Histidine Triad Gene (FHIT, Accession NM_002012) is another VGAM2463 host target gene. FHIT BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FHIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHIT BINDING SITE, designated SEQ ID:7753, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83249] Another function of VGAM2463 is therefore inhibition of Fragile Histidine Triad Gene (FHIT, Accession NM_002012), a gene which cleaves a-5'-ppp-5'a to yield amp and adp. possible tumor suppressor for specific tissues. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with FHIT. The function of FHIT has been established by previous studies. Cohen et al. (1979) observed a constitutional reciprocal t(3;8) translocation associated with early onset, bilateral, and multifocal clear cell renal carcinoma (OMIM Ref. No. 144700). Wang and Perkins (1984) demonstrated that the site of the break on chromosome 3 is at 3p14.2. Another cytogenetic landmark in the 3p14.2 region is the most common of the constitutive aphidicolin-inducible fragile sites, FRA3B (Markkanen et al., 1982). A 200 to 300 kb region of 3p14.2, including the fragile site locus FRA3B, is homozygously deleted in multiple tumor-derived cell lines. By exon amplification from cosmids covering this deleted region, Ohta et al. (1996) identified a human gene they designated FHIT for 'fragile histidine triad' gene. The FHIT gene, a member of the histidine triad gene family, encodes a protein similar to the aph1 gene in S. pombe. The gene is composed of 10 exons distributed over at least 500 kb, with three 5-prime untranslated exons centromeric to the renal carcinoma-associated 3p14.2 breakpoint, the remaining exons telomeric to this translocation breakpoint, and exon 5 within the homozygously deleted fragile region. Aberrant transcripts of the FHIT locus were

found in approximately 50% of esophageal, stomach, and colon carcinomas. Sozzi et al. (1996) analyzed the FHIT gene structure and transcription in a large series of lung cancers of the small cell (SCLC) and nonsmall cell (NSCLC) type. FHIT transcripts from tumors and normal tissues were studied by RT-PCR. In 11 of 14 SCLC tumors, abnormal-sized transcripts were found. Both normal- and abnormal-sized transcripts were present in 9 of these cases. In 18 of 25 NSCLC tumors, abnormal transcripts were found; in these tumors, there were 1 or 2 abnormal-sized bands which were always accompanied by a normal-sized transcript. The authors postulated that the normal-sized transcripts reflected the presence of normal cells within the tumors. Sozzi et al. (1996) reported loss of heterozygosity for microsatellite markers internal to and flanking the FHIT locus. Eleven of 12 informative tumors that exhibited abnormal FHIT transcripts showed allelic loss at one or more of the loci tested. The authors postulated that in these tumors inactivation of the FHIT gene occurred by a mechanism of loss of one allele and altered expression of the remaining allele. They further postulated that loss of function of the FHIT gene could result in the constitutive accumulation of high levels of intracellular

diadenosine tetraphosphate and the stimulation of DNA synthesis and proliferation. Sozzi et al. (1996) proposed that breakage in a fragile site-containing gene may occur as a consequence of physical, chemical, and biologic agents. Virgilio et al. (1996) noted that head and neck cancers (HNSCC; 601400) represent 3% of all cancer in Western countries. In some geographic areas such as India, the proportion of cancer represented by these cancers is as high as 45%; 90 to 95% of head and neck cancers are of the squamous cell type. Tobacco and alcohol have been recognized as etiologic factors in these carcinomas. Several regions of loss of heterozygosity (LOH) have been identified in HNSCC. The 9p region presents the highest rate of genetic alteration (75%) and LOH has been related to the CDKN2 (OMIM Ref. No. 600160) tumor suppressor gene. The second most frequent alteration involves 3p (45 to 55%). Virgilio et al. (1996) examined 26 HNSCC cell lines for deletions within the FHIT locus by Southern analysis, for allelic loss of specific exons of FHIT by fluorescence in situ hybridization, and for integrity of FHIT transcripts. Three of the 26 cell lines exhibited homozygous deletions within the FHIT gene, 55% (15 of 25) showed aberrant transcripts, and 65% (13 of 20) showed multiple

cell populations with losses of different portions of the FHIT alleles. When the data were combined, 22 of 26 cell lines showed alterations of at least 1 allele of the FHIT gene. Thus, Virgilio et al. (1996) concluded that loss of FHIT function may be important in the development and/or progression of head and neck cancers. Animal model experiments lend further support to the function of FHIT. To investigate the role of the Fhit gene in carcinogen induction of neoplasia, Fong et al. (2000) inactivated 1 Fhit allele in mouse embryonic stem cells to produce F1 mice with an inactivated Fhit allele (+/−). Fhit +/+ and +/− mice were treated intragastrically with nitrosomethylbenzylamine and observed for 10 weeks posttreatment. In 25% of the +/+ mice, adenoma or papilloma of the forestomach developed, whereas 100% of the +/− mice developed multiple tumors that were a mixture of adenomas, squamous papillomas, and invasive carcinomas of the forestomach, as well as tumors of sebaceous glands. The visceral and sebaceous tumors, which lacked Fhit protein, were similar to those characteristic of the Muir-Torre familial cancer syndrome (OMIM Ref. No. 158320).

[83250] It is appreciated that the abovementioned animal model for FHIT is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[83251] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83252] Sozzi, G.; Veronese, M. L.; Negrini, M.; Baffa, R.; Cotticelli, M. G.; Inoue, H.; Tornielli, S.; Pilotti, S.; De Gregorio, L.; Pastorino, U.; Pierotti, M. A.; Ohta, M.; Huebner, K.; Croce, C. M. : The FHIT gene at 3p14.2 is abnormal in lung cancer. Cell 85: 17-26, 1996. ; and

[83253] Virgilio, L.; Shuster, M.; Gollin, S. M.; Veronese, M. L.; Ohta, M.; Huebner, K.; Croce, C. M. : FHIT gene alterations in head and neck squamous cell carcinomas. Proc. Nat. Acad. Sci. 9.

[83254] Further studies establishing the function and utilities of FHIT are found in John Hopkins OMIM database record ID 601153, and in sited publications numbered 7544-7545, 12515, 11542, 12516, 2857, 7857-7859, 2858, 9369-9375, 169 and 9376-9378 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FK506 Binding Protein 1A, 12kDa (FKBP1A, Accession NM_000801) is another VGAM2463 host target gene. FKBP1A BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by FKBP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP1A BINDING SITE, designated SEQ ID:6474, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83255] Another function of VGAM2463 is therefore inhibition of FK506 Binding Protein 1A, 12kDa (FKBP1A, Accession NM_000801), a gene which FK506-binding protein 1A. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP1A. The function of FKBP1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57.Fibronectin 1 (FN1, Accession NM_002026) is another VGAM2463 host target gene. FN1 BINDING SITE1 and FN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of FN1 BINDING SITE1 and FN1 BINDING SITE2, designated SEQ ID:7779 and SEQ ID:27645 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83256] Another function of VGAM2463 is therefore inhibition of Fibronectin 1 (FN1, Accession NM_002026), a gene which binds cell surfaces and various compounds including collagen, fibrin, heparin, dna, and actin. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FN1. The function of FN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1063.FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM_022003) is another VGAM2463 host target gene. FXYD6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FXYD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYD6 BINDING SITE, designated SEQ ID:22552, to the nucleotide sequence of

VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83257] Another function of VGAM2463 is therefore inhibition of FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM_022003). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYD6. Frizzled Homolog 7 (Drosophila) (FZD7, Accession NM_003507) is another VGAM2463 host target gene. FZD7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FZD7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD7 BINDING SITE, designated SEQ ID:9600, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83258] Another function of VGAM2463 is therefore inhibition of Frizzled Homolog 7 (Drosophila) (FZD7, Accession NM_003507), a gene which enhances beta-catenin mediated signaling. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD7. The function of FZD7

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1063.UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 2 (GalNAc-T2) (GALNT2, Accession NM_004481) is another VGAM2463 host target gene. GALNT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GALNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT2 BINDING SITE, designated SEQ ID:10799, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83259] Another function of VGAM2463 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 2 (GalNAc-T2) (GALNT2, Accession NM_004481), a gene which catalyzes the initial reaction in o-linked oligosaccharide biosynthesis. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT2. The function of GALNT2 and its asso-

ciation with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM187.UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7) (GALNT7, Accession NM_054110) is another VGAM2463 host target gene. GALNT7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GALNT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT7 BINDING SITE, designated SEQ ID:27651, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83260] Another function of VGAM2463 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7) (GALNT7, Accession NM_054110). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT7. Glial Fibrillary Acidic Protein (GFAP, Accession NM_002055) is another VGAM2463 host target gene.

GFAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFAP BINDING SITE, designated SEQ ID:7815, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83261] Another function of VGAM2463 is therefore inhibition of Glial Fibrillary Acidic Protein (GFAP, Accession NM_002055). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFAP. Guanine Nucleotide Binding Protein (G protein), Alpha 11 (Gq class) (GNA11, Accession XM_072009) is another VGAM2463 host target gene. GNA11 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GNA11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNA11 BINDING SITE, designated SEQ ID:37454, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ

ID:5174.

[83262] Another function of VGAM2463 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha 11 (Gq class) (GNA11, Accession XM_072009), a gene which acts as an activator of phospholipase c. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNA11. The function of GNA11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1956.Guanine Nucleotide Binding Protein (G protein), Alpha Activating Activity Polypeptide O (GNAO1, Accession XM_165653) is another VGAM2463 host target gene. GNAO1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNAO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAO1 BINDING SITE, designated SEQ ID:43721, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83263] Another function of VGAM2463 is therefore inhibition of

Guanine Nucleotide Binding Protein (G protein), Alpha Activating Activity Polypeptide O (GNAO1, Accession XM_165653), a gene which functions as modulators or transducers in various transmembrane signaling systems. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAO1. The function of GNAO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665.GNAS Complex Locus (GNAS, Accession NM_016592) is another VGAM2463 host target gene. GNAS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GNAS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAS BINDING SITE, designated SEQ ID:18679, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83264] Another function of VGAM2463 is therefore inhibition of GNAS Complex Locus (GNAS, Accession NM_016592), a gene which transduces signals from G protein-coupled

receptors and activates adenylyl cyclase. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAS. The function of GNAS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1205.Glutamate Receptor, Metabotropic 4 (GRM4, Accession NM_000841) is another VGAM2463 host target gene. GRM4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM4 BINDING SITE, designated SEQ ID:6504, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83265] Another function of VGAM2463 is therefore inhibition of Glutamate Receptor, Metabotropic 4 (GRM4, Accession NM_000841), a gene which is mediated by a g-protein that inhibits adenylate cyclase activity. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with GRM4. The function of GRM4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1052.Glutamate Receptor, Metabotropic 6 (GRM6, Accession NM_000843) is another VGAM2463 host target gene. GRM6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GRM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM6 BINDING SITE, designated SEQ ID:6508, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83266] Another function of VGAM2463 is therefore inhibition of Glutamate Receptor, Metabotropic 6 (GRM6, Accession NM_000843). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM6. GTF2I Repeat Domain Containing 1 (GTF2IRD1, Accession NM_016328) is another VGAM2463 host target gene. GTF2IRD1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GTF2IRD1, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2IRD1 BINDING SITE, designated SEQ ID:18452, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83267] Another function of VGAM2463 is therefore inhibition of GTF2I Repeat Domain Containing 1 (GTF2IRD1, Accession NM_016328). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2IRD1. Huntingtin-associated Protein 1 (neuroan 1) (HAP1, Accession NM_003949) is another VGAM2463 host target gene. HAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAP1 BINDING SITE, designated SEQ ID:10076, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83268] Another function of VGAM2463 is therefore inhibition of Huntingtin-associated Protein 1 (neuroan 1) (HAP1, Ac-

cession NM_003949), a gene which functions as an adaptor protein using coiled coils to mediate interactions among cytoskeletal, vascular, and motor proteins. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAP1. The function of HAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM126.Host Cell Factor C1 (VP16-accessory protein) (HCFC1, Accession XM_048390) is another VGAM2463 host target gene. HCFC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HCFC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCFC1 BINDING SITE, designated SEQ ID:35157, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83269] Another function of VGAM2463 is therefore inhibition of Host Cell Factor C1 (VP16-accessory protein) (HCFC1, Accession XM_048390), a gene which is a host cell factor, has a role in cell proliferation and can form a complex

with HSV VP16. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCFC1. The function of HCFC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483) is another VGAM2463 host target gene. HMGA2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HMGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:9572, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83270] Another function of VGAM2463 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM2463 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552.HTRA3 (Accession XM_114416) is another VGAM2463 host target gene. HTRA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HTRA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTRA3 BINDING SITE, designated SEQ ID:42940, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83271] Another function of VGAM2463 is therefore inhibition of HTRA3 (Accession XM_114416). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTRA3. Inositol 1,4,5-trisphosphate 3-kinase B (ITPKB, Accession NM_002221) is another VGAM2463 host target gene. ITPKB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITPKB,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPKB BINDING SITE, designated SEQ ID:7982, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83272] Another function of VGAM2463 is therefore inhibition of Inositol 1,4,5-trisphosphate 3-kinase B (ITPKB, Accession NM_002221), a gene which is a type B inositol 1,4,5-triphosphate 3 kinase. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPKB. The function of ITPKB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1252.Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 2 (KCNAB2, Accession NM_003636) is another VGAM2463 host target gene. KCNAB2 BINDING SITE1 and KCNAB2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KCNAB2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of KCNAB2 BINDING SITE1 and KCNAB2 BINDING SITE2, designated SEQ ID:9707 and SEQ ID:9708 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83273] Another function of VGAM2463 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 2 (KCNAB2, Accession NM_003636), a gene which is the beta subunit of shaker voltage-gated potassium channels. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNAB2. The function of KCNAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM659.LIM Domain Kinase 1 (LIMK1, Accession NM_016735) is another VGAM2463 host target gene. LIMK1 BINDING SITE1 through LIMK1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LIMK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK1 BINDING SITE1

through LIMK1 BINDING SITE4, designated SEQ ID:18801, SEQ ID:18803, SEQ ID:8125 and SEQ ID:8126 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83274] Another function of VGAM2463 is therefore inhibition of LIM Domain Kinase 1 (LIMK1, Accession NM_016735). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK1. V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog (avian) (MAF, Accession NM_005360) is another VGAM2463 host target gene. MAF BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAF BINDING SITE, designated SEQ ID:11837, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83275] Another function of VGAM2463 is therefore inhibition of V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog (avian) (MAF, Accession NM_005360), a gene which is a transcription factor; contains a leucine zipper motif.

Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAF. The function of MAF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM822.MAP/microtubule Affinity-regulating Kinase 3 (MARK3, Accession NM_002376) is another VGAM2463 host target gene. MARK3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MARK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MARK3 BINDING SITE, designated SEQ ID:8190, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83276] Another function of VGAM2463 is therefore inhibition of MAP/microtubule Affinity-regulating Kinase 3 (MARK3, Accession NM_002376), a gene which may be involved in cell cycle regulation. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARK3. The func-

tion of MARK3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM964.Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NM_002430) is another VGAM2463 host target gene. MN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MN1 BINDING SITE, designated SEQ ID:8273, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83277] Another function of VGAM2463 is therefore inhibition of Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NM_002430). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MN1. MAX Binding Protein (MNT, Accession NM_020310) is another VGAM2463 host target gene. MNT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MNT, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MNT BINDING SITE, designated SEQ ID:21563, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83278] Another function of VGAM2463 is therefore inhibition of MAX Binding Protein (MNT, Accession NM_020310). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNT. NESH (Accession NM_016428) is another VGAM2463 host target gene. NESH BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NESH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NESH BINDING SITE, designated SEQ ID:18548, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83279] Another function of VGAM2463 is therefore inhibition of NESH (Accession NM_016428), a gene which plays a role in cell growth signalling. Accordingly, utilities of

VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NESH. The function of NESH has been established by previous studies. By screening a hepatocellular cDNA library using PCR with degenerate primers corresponding to p53 (OMIM Ref. No. 191170)/p73 (OMIM Ref. No. 601990) exon domains, followed by probing a placenta cDNA library, Miyazaki et al. (2000) obtained a cDNA encoding an SH3-containing protein they designated NESH (new molecule including SH3). SH3 domains contain about 50 amino acids that bind to proline-rich sequences and often play a role in cell growth signalling. Sequence analysis predicted that the 366-amino acid NESH protein, which is most homologous to SSH3BP1 (OMIM Ref. No. 603050), has a central serine-rich region followed by a proline-rich region and a C-terminal SH3 domain. RT-PCR analysis detected variable expression of NESH in all tissues tested. Miyazaki et al. (2000) suggested that the similarity of NESH to SSH3BP1, an EPS8 (OMIM Ref. No. 600206)-binding protein, indicates that its SH3 domain may interact with other proteins in signal transduction. GENE FUNCTION Using the yeast 2-hybrid system, Matsuda et al. (2001) identified TARSH (OMIM Ref. No.

606279) as a binding partner of NESH.

[83280] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83281] Matsuda, S.; Iriyama, C.; Yokozaki, S.; Ichigotani, Y.; Shirafuji, N.; Yamaki, K.; Hayakawa, T.; Hamaguchi, M. : Cloning and sequencing of a novel human gene that encodes a putative target protein of Nesh-SH3. J. Hum. Genet. 46: 483-486, 2001. ; and

[83282] Miyazaki, K.; Matsuda, S.; Ichigotani, Y.; Takenouchi, Y.; Hayashi, K.; Fukuda, Y.; Nimura, Y.; Hamaguchi, M. : Isolation and characterization of a novel human gene (NESH) which encode.

[83283] Further studies establishing the function and utilities of NESH are found in John Hopkins OMIM database record ID 606363, and in sited publications numbered 451 and 6175 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM_000620) is another VGAM2463 host target gene. NOS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NOS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOS1 BINDING SITE, designated SEQ ID:6231, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83284] Another function of VGAM2463 is therefore inhibition of Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM_000620), a gene which produces nitric oxide (no) which is a messenger molecule with diverse functions throughout the body. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOS1. The function of NOS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.Neurexin 1 (NRXN1, Accession NM_138735) is another VGAM2463 host target gene. NRXN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NRXN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRXN1 BINDING SITE, designated SEQ ID:28996, to the

nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83285] Another function of VGAM2463 is therefore inhibition of Neurexin 1 (NRXN1, Accession NM_138735), a gene which may be involved in cell recognition, cell adhesion, and mediate intracellular signaling. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRXN1. The function of NRXN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191.Occludin (OCLN, Accession NM_002538) is another VGAM2463 host target gene. OCLN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by OCLN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OCLN BINDING SITE, designated SEQ ID:8381, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83286] Another function of VGAM2463 is therefore inhibition of Occludin (OCLN, Accession NM_002538). Accordingly,

utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCLN. Paired Box Gene 2 (PAX2, Accession NM_003987) is another VGAM2463 host target gene. PAX2 BINDING SITE1 through PAX2 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PAX2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE1 through PAX2 BINDING SITE6, designated SEQ ID:10138, SEQ ID:10140, SEQ ID:10141, SEQ ID:10144, SEQ ID:10146 and SEQ ID:10147 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83287] Another function of VGAM2463 is therefore inhibition of Paired Box Gene 2 (PAX2, Accession NM_003987), a gene which involves in kidney cell differentiation. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX2. The function of PAX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM407.Polycystic Kidney Disease 2-like 1 (PKD2L1, Accession NM_016112) is another VGAM2463 host target gene. PKD2L1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PKD2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKD2L1 BINDING SITE, designated SEQ ID:18192, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83288] Another function of VGAM2463 is therefore inhibition of Polycystic Kidney Disease 2-like 1 (PKD2L1, Accession NM_016112). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKD2L1. Pleckstrin (PLEK, Accession NM_002664) is another VGAM2463 host target gene. PLEK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLEK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLEK BINDING SITE, designated SEQ ID:8534,

to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83289] Another function of VGAM2463 is therefore inhibition of Pleckstrin (PLEK, Accession NM_002664), a gene which is the major protein kinase c substrate of platelets. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLEK. The function of PLEK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Paired Mesoderm Homeo Box 1 (PMX1, Accession NM_022716) is another VGAM2463 host target gene. PMX1 BINDING SITE1 and PMX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PMX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMX1 BINDING SITE1 and PMX1 BINDING SITE2, designated SEQ ID:22916 and SEQ ID:13781 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83290] Another function of VGAM2463 is therefore inhibition of

Paired Mesoderm Homeo Box 1 (PMX1, Accession NM_022716), a gene which acts as a transcriptional regulator of muscle creatine kinase. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX1. The function of PMX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.Protein Phosphatase 2A, Regulatory Subunit B' (PR 53) (PPP2R4, Accession XM_026944) is another VGAM2463 host target gene. PPP2R4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP2R4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R4 BINDING SITE, designated SEQ ID:30376, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83291] Another function of VGAM2463 is therefore inhibition of Protein Phosphatase 2A, Regulatory Subunit B' (PR 53) (PPP2R4, Accession XM_026944), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly,

utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R4. The function of PPP2R4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM435.Periaxin (PRX, Accession NM_020956) is another VGAM2463 host target gene. PRX BINDING SITE1 and PRX BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PRX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRX BINDING SITE1 and PRX BINDING SITE2, designated SEQ ID:21935 and SEQ ID:21940 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83292] Another function of VGAM2463 is therefore inhibition of Periaxin (PRX, Accession NM_020956), a gene which seems to be required for maintenance of peripheral nerve myelin sheath. may have a role in axon-glial interactions, possibly by interacting with the cytoplasmic domains of integral membrane proteins such as myelin-associated

glycoprotein in the periaxonal regions of the schwann cell plasma membrane. may have a role in the early phases of myelin deposition. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRX. The function of PRX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM476.Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_000962) is another VGAM2463 host target gene. PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTGS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2, designated SEQ ID:6673 and SEQ ID:8744 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83293] Another function of VGAM2463 is therefore inhibition of Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/

H synthase and cyclooxygenase) (PTGS1, Accession NM_000962), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1. The function of PTGS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224.Protein Tyrosine Phosphatase, Receptor Type, S (PTPRS, Accession NM_130853) is another VGAM2463 host target gene. PTPRS BINDING SITE1 through PTPRS BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRS, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRS BINDING SITE1 through PTPRS BINDING SITE4, designated SEQ ID:28390, SEQ ID:28391, SEQ ID:8767 and SEQ ID:12130 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83294] Another function of VGAM2463 is therefore inhibition of

Protein Tyrosine Phosphatase, Receptor Type, S (PTPRS, Accession NM_130853), a gene which controls motor axon guidance and may be a cell adhesion receptor. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRS. The function of PTPRS has been established by previous studies. Protein-tyrosine phosphatase sigma (PTPRS) is a receptor type protein-tyrosine phosphatase that has been cloned and identified in mouse, in rat, and in human (Pulido et al., 1995). PTPRS is a member of a subfamily of receptor type PTPases that includes LAR (OMIM Ref. No. 179590) and PTP-delta. Wagner et al. (1996) noted that this subfamily of cell surface glycoproteins is characterized by the presence of an extracellular cell adhesion molecule-like motif and 2 intracellular phosphatase domains. Transcripts of these genes are subject to RNA processing, resulting in several distinct isoforms. These proteins share a high overall degree of sequence similarity, especially in the second intracellular catalytic domain, which is thought to interact with the same molecule. Analysis of the expression pattern of PTPRS suggests that it may be involved in the development of the nervous system. Batt et al. (2002) examined the

role of PTP on pituitary, pancreas, and enteroendocrine cytodifferentiation, hormone production, and development. The adenohypophyses of PTPRS-null mice were small and exhibited reduced GH (see OMIM Ref. No. 139250) and PRL (OMIM Ref. No. 176760) immunoreactivity. Cells containing TSH (see OMIM Ref. No. 188530), LH (see OMIM Ref. No. 152780), FSH (see OMIM Ref. No. 136530), ACTH, pituitary-specific POU homeodomain factor (Pit1; 173110), estrogen receptor (see OMIM Ref. No. 133430), and steroidogenic factor-1 (OMIM Ref. No. 184757) were found in normal proportions and distributions. The diminished expression of GH and PRL was not associated with apoptosis of somatotrophs or lactotrophs. In the knockout mice, pancreatic islets were hypoplastic with reduced insulin immunoreactivity, and there was also variable expression of gut hormones. Functionally, the GH deficiency was associated with hypoglycemia and death in the PTPRS-null neonates, and accordingly, intraperitoneal administration of GH rescued the PTPRS-null neonates and normalized the blood glucose. The authors concluded that PTP-sigma plays a major role in differentiation and development of the neuroendocrine system. Animal model experiments lend further support to the function of PT-

PRS. On the basis of its expression and homology with the Drosophila melanogaster orthologs, which have roles in the targeting of axonal growth cones, Elchebly et al. (1999) hypothesized that PTP-sigma may also have a modulating function in cell-cell interactions, as well as in axon guidance during mammalian embryogenesis. To investigate its function in vivo, they generated Ptprs-deficient mice. The resulting Ptprs -/- animals displayed retarded growth, increased neonatal mortality, hyposmia, and hypofecundity. Anatomic and histologic analyses showed a decrease in overall brain size with severe depletion of luteinizing hormone-releasing hormone (OMIM Ref. No. 152760)-immunoreactive cells in the hypothalamus of the Ptprs -/- mice. These mice also had an enlarged intermediate pituitary lobe, but smaller anterior and posterior lobes. These results suggested that tyrosine phosphorylation-dependent signaling pathways regulated by PTP-sigma influence the proliferation and/or adhesiveness of various cell types in the developing hypothalamopituitary axis.

[83295] It is appreciated that the abovementioned animal model for PTPRS is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[83296] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83297] Batt, J.; Asa, S.; Fladd, C.; Rotin, D. : Pituitary, pancreatic and gut neuroendocrine defects in protein tyrosine phosphatase-sigma-deficient mice. Molec. Endocr. 16: 155-169, 2002. ; and

[83298] Elchebly, M.; Wagner, J.; Kennedy, T. E.; Lanctot, C.; Michaliszyn, E.; Itie, A.; Drouin, J.; Tremblay, M. L. : Neuroendocrine dysplasia in mice lacking protein tyrosine phosphatase sig.

[83299] Further studies establishing the function and utilities of PTPRS are found in John Hopkins OMIM database record ID 601576, and in sited publications numbered 6677-6681 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Radical Fringe Homolog (Drosophila) (RFNG, Accession XM_113942) is another VGAM2463 host target gene. RFNG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RFNG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of RFNG BINDING SITE, designated SEQ ID:42558, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83300] Another function of VGAM2463 is therefore inhibition of Radical Fringe Homolog (Drosophila) (RFNG, Accession XM_113942), a gene which controls activation of the Notch signal transduction pathway;. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFNG. The function of RFNG has been established by previous studies. Fringe proteins can positively and negatively modulate the ability of Notch ligands to activate the Notch receptor. Moloney et al. (2000) established the biochemical mechanism of Fringe action. Drosophila and mammalian Fringe proteins possess a fucose-specific beta-1,3 N-acetylglucosaminyltransferase activity that initiates elongation of O-linked fucose residues attached to epidermal growth factor (EGF; 131530)-like sequence repeats of Notch. They obtained biologic evidence that Fringe-dependent elongation of O-linked fucose on Notch modulates Notch signaling by using coculture assays in mammalian cells and by expression of an enzymatically

inactive Fringe mutant in Drosophila. Bruckner et al. (2000) showed that Fringe acts in the Golgi as a glycosyltransferase enzyme that modifies the EGF modules of Notch and alters the ability of Notch to bind its ligand Delta (OMIM Ref. No. 602768). The authors demonstrated that Fringe catalyzes the addition of N-acetylglucosamine to fucose, which is consistent with a role in the elongation of O-linked fucose O-glycosylation that is associated with EGF repeats. Vertebrate limb outgrowth requires a structure called the apical ectodermal ridge (AER), formation of which relies on the previous establishment of the dorsoventral limb axis. The AER of the vertebrate limb bud lies at the junction of the dorsal and ventral ectoderm and directs patterning of the growing limb outgrowth. Rfng is expressed in the dorsal ectoderm before the ridge appears, and is repressed by Engrailed-1 (OMIM Ref. No. 131290), which is expressed in the ventral ectoderm. Rodriguez-Esteban et al. (1997) found that misexpression of these genes results in a ridge being formed wherever there is a boundary between cells expressing and not expressing Rfng. Thus, as in Drosophila, Rfng positions the ridge at the dorsoventral limb boundary. The results of Laufer et al. (1997) supported the hypothesis that the AER

forms at the juxtaposition of Rfng-expressing and nonexpressing cells, and furthermore dissociate the molecular control of AER formation from that of dorsoventral tissue specification. Laufer et al. (1997) also found that Rfng expression in chick limb dorsal ectoderm is established in part through repression by Engrailed-1 in the ventral ectoderm.

[83301] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83302] Moloney, D. J.; Panin, V. M.; Johnston, S. H.; Chen, J.; Shao, L.; Wilson, R.; Wang, Y.; Stanley, P.; Irvine, K. D.; Haltiwanger, R. S.; Vogt, T. F. : Fringe is a glycosyltransferase that modifies Notch. Nature 406: 369-375, 2000. ; and

[83303] Laufer, E.; Dahn, R.; Orozco, O. E.; Yeo, C.-Y.; Pisenti, J.; Henrique, D.; Abbott, U. K.; Fallon, J. F.; Tabin, C. : Expression of Radical fringe in limb-bud ectoderm regulates apical.

[83304] Further studies establishing the function and utilities of RFNG are found in John Hopkins OMIM database record ID 602578, and in sited publications numbered 5746, 7964, 7966, 1235 and 7967 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence.Ret Finger Protein (RFP, Accession NM_006510) is another VGAM2463 host target gene. RFP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RFP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFP BINDING SITE, designated SEQ ID:13260, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83305] Another function of VGAM2463 is therefore inhibition of Ret Finger Protein (RFP, Accession NM_006510), a gene which involvels in transcriptional regulation and may act in male germ cell development . Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFP. The function of RFP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM302.Retinoschisis (X-linked, juvenile) 1 (RS1, Accession NM_000330) is another VGAM2463 host target gene. RS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

RS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RS1 BINDING SITE, designated SEQ ID:5878, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83306] Another function of VGAM2463 is therefore inhibition of Retinoschisis (X-linked, juvenile) 1 (RS1, Accession NM_000330). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RS1. Retinoid X Receptor, Alpha (RXRA, Accession NM_002957) is another VGAM2463 host target gene. RXRA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RXRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RXRA BINDING SITE, designated SEQ ID:8869, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83307] Another function of VGAM2463 is therefore inhibition of Retinoid X Receptor, Alpha (RXRA, Accession NM_002957),

a gene which activates genes required for vitamin A metabolism, binds 9-cis retinoic acid. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RXRA. The function of RXRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM349.Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM_002999) is another VGAM2463 host target gene. SDC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC4 BINDING SITE, designated SEQ ID:8891, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83308] Another function of VGAM2463 is therefore inhibition of Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM_002999), a gene which is a cell surface proteoglycan. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with SDC4. The function of SDC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552.SET7 (Accession NM_030648) is another VGAM2463 host target gene. SET7 BINDING SITE1 and SET7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SET7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SET7 BINDING SITE1 and SET7 BINDING SITE2, designated SEQ ID:24981 and SEQ ID:24982 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83309] Another function of VGAM2463 is therefore inhibition of SET7 (Accession NM_030648). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SET7. Sine Oculis Homeobox Homolog 3 (Drosophila) (SIX3, Accession NM_005413) is another VGAM2463 host target gene. SIX3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

SIX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIX3 BINDING SITE, designated SEQ ID:11882, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83310] Another function of VGAM2463 is therefore inhibition of Sine Oculis Homeobox Homolog 3 (Drosophila) (SIX3, Accession NM_005413), a gene which may be involved in visual system development. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIX3. The function of SIX3 has been established by previous studies. Holoprosencephaly (HPE) is a common, severe malformation of the brain that involves separation of the central nervous system into left and right halves. Mild HPE can consist of signs such as a single central incisor, hypotelorism, microcephaly, or other craniofacial findings that can be present with or without associated brain malformations. The etiology of HPE is highly heterogeneous, with the proposed participation of a minimum of 12 HPE-associated genetic loci as well as the causal involvement of specific teratogens acting at the earliest stages of neu-

rulation (Roessler and Muenke, 1998). Schell et al. (1996) mapped the HPE2 (OMIM Ref. No. 157170) locus to a 1-Mb interval on 2p21 and defined a minimal critical region by a set of 6 overlapping deletions and 3 clustered translocations in HPE patients. Wallis et al. (1999) described the isolation and characterization of the homeo box-containing SIX3 gene from the HPE2 minimal critical region. They showed that at least 2 of the HPE-associated translocation breakpoints in 2p21 are less than 200 kb from the 5-prime end of SIX3. Mutational analysis identified 4 different mutations in the homeodomain of SIX3 that were predicted to interfere with transcriptional activation and were associated with HPE. Wallis et al. (1999) proposed that SIX3 is the HPE2 gene, essential for the development of the anterior neural plate and eyes in humans.

[83311] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83312] Roessler, E.; Muenke, M. : Holoprosencephaly: a paradigm for the complex genetics of brain development. J. Inherit. Metab. Dis. 21: 481-497, 1998. ; and

[83313] Wallis, D. E.; Roessler, E.; Hehr, U.; Nanni, L.; Wiltshire, T.;

Richieri-Costa, A.; Gillessen-Kaesbach, G.; Zackai, E. H.; Rommens, J.; Muenke, M. : Mutations in the homeodomain of t.

[83314] Further studies establishing the function and utilities of SIX3 are found in John Hopkins OMIM database record ID 603714, and in sited publications numbered 5287-529 and 11447 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM_006517) is another VGAM2463 host target gene. SLC16A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC16A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A2 BINDING SITE, designated SEQ ID:13269, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83315] Another function of VGAM2463 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Ac-

cession NM_006517). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A2. Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM_005629) is another VGAM2463 host target gene. SLC6A8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC6A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A8 BINDING SITE, designated SEQ ID:12150, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83316] Another function of VGAM2463 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM_005629). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A8. Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 5 (SLC9A5, Accession NM_004594) is another VGAM2463 host target gene. SLC9A5 BINDING SITE1 and SLC9A5 BINDING SITE2 are

HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC9A5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A5 BINDING SITE1 and SLC9A5 BINDING SITE2, designated SEQ ID:10936 and SEQ ID:30065 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83317] Another function of VGAM2463 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 5 (SLC9A5, Accession NM_004594). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A5. Stanniocalcin 1 (STC1, Accession NM_003155) is another VGAM2463 host target gene. STC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STC1 BINDING SITE, designated SEQ ID:9134, to the nucleotide sequence of VGAM2463 RNA, herein

designated VGAM RNA, also designated SEQ ID:5174.

[83318] Another function of VGAM2463 is therefore inhibition of Stanniocalcin 1 (STC1, Accession NM_003155), a gene which stimulates renal phosphate reabsorption, and could therefore prevent hypercalcemia. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STC1. The function of STC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM623.Serine/threonine Kinase 13 (aurora/IPL1-like) (STK13, Accession NM_003160) is another VGAM2463 host target gene. STK13 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by STK13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK13 BINDING SITE, designated SEQ ID:9139, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83319] Another function of VGAM2463 is therefore inhibition of Serine/threonine Kinase 13 (aurora/IPL1-like) (STK13, Ac-

cession NM_003160), a gene which is a testis-specific serine/threonine kinase. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK13. The function of STK13 has been established by previous studies. The Drosophila 'Aurora' and S. cerevisiae Ipl1 protein kinases are involved in mitotic events such as centrosome separation and chromosome segregation. By screening a human placenta library with Xenopus Eg2 (an Aurora/Ipl1-related kinase) cDNA, Bernard et al. (1998) isolated a partial STK13 cDNA. They obtained a full-length cDNA using RACE on testis mRNA. The catalytic domain of the predicted 275-amino acid protein shares 80% and 68% identity with those of AURORA2 (OMIM Ref. No. 603072) and AIK (OMIM Ref. No. 602687), respectively. Independently, Tseng et al. (1998) isolated cDNAs encoding 2 novel protein kinases, mouse Aie1 (Aurora/Ipl1/EG2-1) and human STK13, which they designated AIE2. Both Aie1 and AIE2 contain a central serine/threonine kinase domain. The authors reported that AIE2 contains 309 amino acids. Northern blot analysis detected expression of a 1.35-kb AIE2 mRNA only in testis. Full-grown Xenopus oocytes arrest at the G2/M border of meiosis I. Proges-

terone breaks this arrest, leading to the resumption of the meiotic cell cycles and maturation of the oocyte into a fertilizable egg. In these oocytes, progesterone interacts with an unidentified surface-associated receptor, which induces a nontranscriptional signaling pathway that stimulates the translation of dormant c-mos mRNA. The translational recruitment of c-mos and several other mRNAs is regulated by cytoplasmic polyadenylation, a process that requires two 3-prime untranslated regions, the cytoplasmic polyadenylation element (CPE) and the polyadenylation hexanucleotide AAUAAA. Mendez et al. (2000) demonstrated that an early site-specific phosphorylation of CPEB (the CPE binding factor) is essential for the polyadenylation of c-mos mRNA and its subsequent translation, and for oocyte maturation. In addition, they showed that this selective, early phosphorylation of CPEB is catalyzed by Eg2.

[83320] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83321] Bernard, M.; Sanseau, P.; Henry, C.; Couturier, A.; Prigent, C. : Cloning of STK13, a third human protein kinase related to Drosophila Aurora and budding yeast Ipl1 that

maps on chromosome 19q13.3-ter. Genomics 53: 406-409, 1998. ; and

[83322] Mendez, R.; Hake, L. E.; Andresson, T.; Littlepage, L. E.; Ruderman, J. V.; Richter, J. D. : Phosphorylation of CPE binding factor by Eg2 regulates translation of c-mos mRNA. Nature 404.

[83323] Further studies establishing the function and utilities of STK13 are found in John Hopkins OMIM database record ID 603495, and in sited publications numbered 851 and 10269 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM_016169) is another VGAM2463 host target gene. SUFU BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SUFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUFU BINDING SITE, designated SEQ ID:18257, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83324] Another function of VGAM2463 is therefore inhibition of Suppressor of Fused Homolog (Drosophila) (SUFU, Acces-

sion NM_016169). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUFU. Suppressor of Ty 6 Homolog (S. cerevisiae) (SUPT6H, Accession XM_017037) is another VGAM2463 host target gene. SUPT6H BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SUPT6H, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUPT6H BINDING SITE, designated SEQ ID:30292, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83325] Another function of VGAM2463 is therefore inhibition of Suppressor of Ty 6 Homolog (S. cerevisiae) (SUPT6H, Accession XM_017037), a gene which may normally act to repress transcription at a variety of loci, and also plays a role in chromatin structure or assembly. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUPT6H. The function of SUPT6H and its association with various diseases and clinical conditions, has been es-

tablished by previous studies, as described hereinabove with reference to VGAM1959.Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM_006283) is another VGAM2463 host target gene. TACC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TACC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACC1 BINDING SITE, designated SEQ ID:12964, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83326] Another function of VGAM2463 is therefore inhibition of Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM_006283). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACC1. Tafazzin (cardiomyopathy, dilated 3A (X-linked); Endocardial Fibroelastosis 2; Barth Syndrome) (TAZ, Accession NM_000116) is another VGAM2463 host target gene. TAZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAZ, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAZ BINDING SITE, designated SEQ ID:5585, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83327] Another function of VGAM2463 is therefore inhibition of Tafazzin (cardiomyopathy, dilated 3A (X-linked); Endocardial Fibroelastosis 2; Barth Syndrome) (TAZ, Accession NM_000116). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAZ. Telomeric Repeat Binding Factor 2 (TERF2, Accession NM_005652) is another VGAM2463 host target gene. TERF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TERF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERF2 BINDING SITE, designated SEQ ID:12189, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83328] Another function of VGAM2463 is therefore inhibition of Telomeric Repeat Binding Factor 2 (TERF2, Accession

NM_005652), a gene which plays a key role in the protective activity of telomeres. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERF2. The function of TERF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1689.TIRAP (Accession NM_052887) is another VGAM2463 host target gene. TIRAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIRAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIRAP BINDING SITE, designated SEQ ID:27477, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83329] Another function of VGAM2463 is therefore inhibition of TIRAP (Accession NM_052887), a gene which is a adapter involved in theTLR4 signaling pathway in the innate immune response. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIRAP. The function of

TIRAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM189.Thiopurine S-methyltransferase (TPMT, Accession NM_000367) is another VGAM2463 host target gene. TPMT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TPMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPMT BINDING SITE, designated SEQ ID:5939, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83330] Another function of VGAM2463 is therefore inhibition of Thiopurine S-methyltransferase (TPMT, Accession NM_000367), a gene which catalyzes the s-methylation of thiopurine drugs such as 6-mercaptopurine. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPMT. The function of TPMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM682.Unc-5 Homolog B (C. elegans)

(UNC5C, Accession NM_003728) is another VGAM2463 host target gene. UNC5C BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by UNC5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5C BINDING SITE, designated SEQ ID:9819, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83331] Another function of VGAM2463 is therefore inhibition of Unc-5 Homolog B (C. elegans) (UNC5C, Accession NM_003728), a gene which is a putative receptor for netrin, which is involved in axon guidance. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5C. The function of UNC5C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM298.Vasodilator-stimulated Phosphoprotein (VASP, Accession NM_003370) is another VGAM2463 host target gene. VASP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by VASP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VASP BINDING SITE, designated SEQ ID:9397, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83332] Another function of VGAM2463 is therefore inhibition of Vasodilator-stimulated Phosphoprotein (VASP, Accession NM_003370), a gene which may act in concert with profilin to convey signal transduction to actin filament production. Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VASP. The function of VASP has been established by previous studies. Human platelet activation is inhibited by agents such as prostaglandins and NO donors, which elevate cAMP or cGMP levels. The vasodilator-stimulated phosphoprotein (VASP) is phosphorylated in human platelets in response to both cAMP- and cGMP-elevating agents, and its phosphorylation correlates with platelet inhibition. Haffner et al. (1995) cloned the VASP gene from human and canine cells and showed that VASP is a 380-amino acid protein with a predicted molec-

ular mass of 39.8 kD. Brindle et al. (1996) showed that VASP binds to the proline-rich domain of vinculin (OMIM Ref. No. 193065). They suggested that this interaction is important for actin-filament assembly and focal adhesion stability. Zimmer et al. (1996) cloned human and mouse VASP from genomic cosmid libraries. They determined that the human and mouse VASP genes are 89% identical at the amino acid level and are both assembled of 13 exons and span a genomic DNA region of approximately 20 kb. They mapped human VASP to chromosome 19q13.2-q13.3 using fluorescence in situ hybridization. They noted that VASP is located about 92 kb distal to ERCC1 (OMIM Ref. No. 126380) and about 300 kb proximal to the myotonic dystrophy protein kinase gene (OMIM Ref. No. 160900).

[83333] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83334] Brindle, N. P. J.; Holt, M. R.; Davies, J. E.; Price, C. J.; Critchley, D. R. : The focal-adhesion vasodilator-stimulated phosphoprotein (VASP) binds to the proline-rich domain in vinculin. Biochem. J. 318: 753-757, 1996. ; and

[83335] Zimmer, M.; Fink, T.; Fischer, L.; Hauser, W.; Scherer, K.;

Lichter, P.; Walter, U. : Cloning of the VASP (vasodilator-stimulated phosphoprotein) genes in human and mouse: structure, seque.

[83336] Further studies establishing the function and utilities of VASP are found in John Hopkins OMIM database record ID 601703, and in sited publications numbered 2862-2864 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Wingless-type MMTV Integration Site Family, Member 1 (WNT1, Accession NM_005430) is another VGAM2463 host target gene. WNT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT1 BINDING SITE, designated SEQ ID:11897, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83337] Another function of VGAM2463 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 1 (WNT1, Accession NM_005430), a gene which may have a role in development of the central nervous system. Accordingly, utilities of VGAM2463 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with WNT1. The function of WNT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.Wingless-type MMTV Integration Site Family, Member 5B (WNT5B, Accession NM_032642) is another VGAM2463 host target gene. WNT5B BINDING SITE1 and WNT5B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WNT5B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT5B BINDING SITE1 and WNT5B BINDING SITE2, designated SEQ ID:26360 and SEQ ID:25058 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83338] Another function of VGAM2463 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 5B (WNT5B, Accession NM_032642), a gene which is the ligand for members of the frizzled family of seven transmembrane receptors and may be a signaling molecule . Accordingly, utilities of VGAM2463 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with WNT5B. The function of WNT5B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1928.A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM_016248) is another VGAM2463 host target gene. AKAP11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKAP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP11 BINDING SITE, designated SEQ ID:18375, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83339] Another function of VGAM2463 is therefore inhibition of A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM_016248). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP11. Angiomotin (AMOT, Accession NM_133265) is another VGAM2463 host target gene. AMOT BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by AMOT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOT BINDING SITE, designated SEQ ID:28419, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83340] Another function of VGAM2463 is therefore inhibition of Angiomotin (AMOT, Accession NM_133265). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOT. BA108L7.2 (Accession NM_030971) is another VGAM2463 host target gene. BA108L7.2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BA108L7.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, designated SEQ ID:25238, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83341] Another function of VGAM2463 is therefore inhibition of

BA108L7.2 (Accession NM_030971). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA108L7.2. Bifunctional Apoptosis Regulator (BFAR, Accession XM_027311) is another VGAM2463 host target gene. BFAR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BFAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BFAR BINDING SITE, designated SEQ ID:30479, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83342] Another function of VGAM2463 is therefore inhibition of Bifunctional Apoptosis Regulator (BFAR, Accession XM_027311). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BFAR. Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM_167769) is another VGAM2463 host target gene. C11orf11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf11, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf11 BINDING SITE, designated SEQ ID:44787, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83343] Another function of VGAM2463 is therefore inhibition of Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM_167769). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf11. Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575) is another VGAM2463 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:19004, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83344] Another function of VGAM2463 is therefore inhibition of

Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31. C1q and Tumor Necrosis Factor Related Protein 2 (C1QTNF2, Accession NM_031908) is another VGAM2463 host target gene. C1QTNF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1QTNF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF2 BINDING SITE, designated SEQ ID:25651, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83345] Another function of VGAM2463 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 2 (C1QTNF2, Accession NM_031908). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF2. Chromosome 20 Open Reading Frame 142 (C20orf142, Accession XM_059257) is another VGAM2463 host target gene. C20orf142 BINDING SITE is HOST TAR-

GET binding site found in the 3` untranslated region of mRNA encoded by C20orf142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf142 BINDING SITE, designated SEQ ID:36930, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83346] Another function of VGAM2463 is therefore inhibition of Chromosome 20 Open Reading Frame 142 (C20orf142, Accession XM_059257). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf142. Chromosome 22 Open Reading Frame 4 (C22orf4, Accession XM_027143) is another VGAM2463 host target gene. C22orf4 BINDING SITE1 and C22orf4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C22orf4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf4 BINDING SITE1 and C22orf4 BINDING SITE2, designated SEQ ID:30422 and SEQ ID:30423 respectively,

to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83347] Another function of VGAM2463 is therefore inhibition of Chromosome 22 Open Reading Frame 4 (C22orf4, Accession XM_027143). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf4. Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM_006549) is another VGAM2463 host target gene. CAMKK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAMKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:13311, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83348] Another function of VGAM2463 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM_006549). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with CAMKK2. CDP-diacylglycerol--inositol 3-phosphatidyltransferase (phosphatidylinositol synthase) (CDIPT, Accession NM_006319) is another VGAM2463 host target gene. CDIPT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDIPT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDIPT BINDING SITE, designated SEQ ID:13009, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83349] Another function of VGAM2463 is therefore inhibition of CDP-diacylglycerol--inositol 3-phosphatidyltransferase (phosphatidylinositol synthase) (CDIPT, Accession NM_006319). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDIPT. Cat Eye Syndrome Chromosome Region, Candidate 6 (CECR6, Accession NM_031890) is another VGAM2463 host target gene. CECR6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CECR6, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR6 BINDING SITE, designated SEQ ID:25637, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83350] Another function of VGAM2463 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 6 (CECR6, Accession NM_031890). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR6. Choline Kinase (CHK, Accession NM_001277) is another VGAM2463 host target gene. CHK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHK BINDING SITE, designated SEQ ID:6945, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83351] Another function of VGAM2463 is therefore inhibition of Choline Kinase (CHK, Accession NM_001277). Accord-

ingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHK. Calsyntenin 3 (CLSTN3, Accession NM_014718) is another VGAM2463 host target gene. CLSTN3 BINDING SITE1 and CLSTN3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CLSTN3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLSTN3 BINDING SITE1 and CLSTN3 BINDING SITE2, designated SEQ ID:16274 and SEQ ID:16275 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83352] Another function of VGAM2463 is therefore inhibition of Calsyntenin 3 (CLSTN3, Accession NM_014718). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLSTN3. Cyclin M3 (CNNM3, Accession NM_017623) is another VGAM2463 host target gene. CNNM3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNNM3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM3 BINDING SITE, designated SEQ ID:19124, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83353] Another function of VGAM2463 is therefore inhibition of Cyclin M3 (CNNM3, Accession NM_017623). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM3. DCNP1 (Accession NM_130848) is another VGAM2463 host target gene. DCNP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCNP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCNP1 BINDING SITE, designated SEQ ID:28384, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83354] Another function of VGAM2463 is therefore inhibition of DCNP1 (Accession NM_130848). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with DCNP1. Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM_002384) is another VGAM2463 host target gene. DGKD BINDING SITE1 and DGKD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DGKD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKD BINDING SITE1 and DGKD BINDING SITE2, designated SEQ ID:29880 and SEQ ID:29882 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83355] Another function of VGAM2463 is therefore inhibition of Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM_002384). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKD. DKFZP434N178 (Accession XM_050278) is another VGAM2463 host target gene. DKFZP434N178 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434N178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N178 BINDING SITE, designated SEQ ID:35596, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83356] Another function of VGAM2463 is therefore inhibition of DKFZP434N178 (Accession XM_050278). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N178. DKFZp547I094 (Accession NM_032155) is another VGAM2463 host target gene. DKFZp547I094 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp547I094, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I094 BINDING SITE, designated SEQ ID:25856, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83357] Another function of VGAM2463 is therefore inhibition of DKFZp547I094 (Accession NM_032155). Accordingly, utilities of VGAM2463 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp547I094. DKFZp547M072 (Accession XM_028067) is another VGAM2463 host target gene. DKFZp547M072 BINDING SITE1 and DKFZp547M072 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZp547M072, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547M072 BINDING SITE1 and DKFZp547M072 BINDING SITE2, designated SEQ ID:30617 and SEQ ID:30618 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83358] Another function of VGAM2463 is therefore inhibition of DKFZp547M072 (Accession XM_028067). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547M072. DKFZP586M1120 (Accession NM_031294) is another VGAM2463 host target gene. DKFZP586M1120 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586M1120, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586M1120 BINDING SITE, designated SEQ ID:25321, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83359] Another function of VGAM2463 is therefore inhibition of DKFZP586M1120 (Accession NM_031294). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M1120. DKFZp762A227 (Accession NM_014096) is another VGAM2463 host target gene. DKFZp762A227 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp762A227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762A227 BINDING SITE, designated SEQ ID:15319, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83360] Another function of VGAM2463 is therefore inhibition of DKFZp762A227 (Accession NM_014096). Accordingly,

utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762A227. EFS2 (Accession NM_005864) is another VGAM2463 host target gene. EFS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EFS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFS2 BINDING SITE, designated SEQ ID:12477, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83361] Another function of VGAM2463 is therefore inhibition of EFS2 (Accession NM_005864). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFS2. Ets2 Repressor Factor (ERF, Accession NM_006494) is another VGAM2463 host target gene. ERF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ERF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERF BINDING SITE,

designated SEQ ID:13235, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83362] Another function of VGAM2463 is therefore inhibition of Ets2 Repressor Factor (ERF, Accession NM_006494). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERF. Fem-1 Homolog B (C. elegans) (FEM1B, Accession NM_015322) is another VGAM2463 host target gene. FEM1B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FEM1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEM1B BINDING SITE, designated SEQ ID:17641, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83363] Another function of VGAM2463 is therefore inhibition of Fem-1 Homolog B (C. elegans) (FEM1B, Accession NM_015322). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEM1B. FHX (Accession

NM_018416) is another VGAM2463 host target gene. FHX BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FHX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHX BINDING SITE, designated SEQ ID:20458, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83364] Another function of VGAM2463 is therefore inhibition of FHX (Accession NM_018416). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHX. FLJ00024 (Accession XM_033361) is another VGAM2463 host target gene. FLJ00024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:31890, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83365] Another function of VGAM2463 is therefore inhibition of FLJ00024 (Accession XM_033361). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024. FLJ00058 (Accession XM_086123) is another VGAM2463 host target gene. FLJ00058 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ00058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00058 BINDING SITE, designated SEQ ID:38510, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83366] Another function of VGAM2463 is therefore inhibition of FLJ00058 (Accession XM_086123). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00058. FLJ10276 (Accession NM_018045) is another VGAM2463 host target gene. FLJ10276 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10276 BINDING SITE, designated SEQ ID:19792, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83367] Another function of VGAM2463 is therefore inhibition of FLJ10276 (Accession NM_018045). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10276. FLJ10769 (Accession NM_018210) is another VGAM2463 host target gene. FLJ10769 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10769 BINDING SITE, designated SEQ ID:20113, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83368] Another function of VGAM2463 is therefore inhibition of FLJ10769 (Accession NM_018210). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10769. FLJ11807 (Accession NM_024954) is another VGAM2463 host target gene. FLJ11807 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11807, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11807 BINDING SITE, designated SEQ ID:24512, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83369] Another function of VGAM2463 is therefore inhibition of FLJ11807 (Accession NM_024954). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11807. FLJ13114 (Accession NM_024541) is another VGAM2463 host target gene. FLJ13114 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13114 BINDING SITE, designated SEQ ID:23752, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM

RNA, also designated SEQ ID:5174.

[83370] Another function of VGAM2463 is therefore inhibition of FLJ13114 (Accession NM_024541). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13114. FLJ13154 (Accession NM_024598) is another VGAM2463 host target gene. FLJ13154 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13154 BINDING SITE, designated SEQ ID:23844, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83371] Another function of VGAM2463 is therefore inhibition of FLJ13154 (Accession NM_024598). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13154. FLJ13158 (Accession NM_024909) is another VGAM2463 host target gene. FLJ13158 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13158, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13158 BINDING SITE, designated SEQ ID:24410, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83372] Another function of VGAM2463 is therefore inhibition of FLJ13158 (Accession NM_024909). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13158. FLJ13189 (Accession NM_024882) is another VGAM2463 host target gene. FLJ13189 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13189 BINDING SITE, designated SEQ ID:24332, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83373] Another function of VGAM2463 is therefore inhibition of FLJ13189 (Accession NM_024882). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13189. FLJ13193 (Accession NM_032177) is another VGAM2463 host target gene. FLJ13193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13193 BINDING SITE, designated SEQ ID:25892, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83374] Another function of VGAM2463 is therefore inhibition of FLJ13193 (Accession NM_032177). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13193. FLJ13612 (Accession NM_025202) is another VGAM2463 host target gene. FLJ13612 BINDING SITE1 and FLJ13612 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ13612, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13612 BINDING SITE1 and FLJ13612

BINDING SITE2, designated SEQ ID:24861 and SEQ ID:24862 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83375] Another function of VGAM2463 is therefore inhibition of FLJ13612 (Accession NM_025202). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13612. FLJ14154 (Accession NM_024845) is another VGAM2463 host target gene. FLJ14154 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14154 BINDING SITE, designated SEQ ID:24271, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83376] Another function of VGAM2463 is therefore inhibition of FLJ14154 (Accession NM_024845). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14154. FLJ14249 (Accession NM_106552) is another

VGAM2463 host target gene. FLJ14249 BINDING SITE1 and FLJ14249 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ14249, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14249 BINDING SITE1 and FLJ14249 BINDING SITE2, designated SEQ ID:28170 and SEQ ID:22800 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83377] Another function of VGAM2463 is therefore inhibition of FLJ14249 (Accession NM_106552). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14249. FLJ14442 (Accession NM_032785) is another VGAM2463 host target gene. FLJ14442 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14442 BINDING SITE, designated SEQ ID:26537, to the nucleotide

sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83378] Another function of VGAM2463 is therefore inhibition of FLJ14442 (Accession NM_032785). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14442. FLJ20378 (Accession NM_017795) is another VGAM2463 host target gene. FLJ20378 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20378 BINDING SITE, designated SEQ ID:19436, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83379] Another function of VGAM2463 is therefore inhibition of FLJ20378 (Accession NM_017795). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20378. FLJ20651 (Accession NM_017919) is another VGAM2463 host target gene. FLJ20651 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ20651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20651 BINDING SITE, designated SEQ ID:19575, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83380] Another function of VGAM2463 is therefore inhibition of FLJ20651 (Accession NM_017919). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20651. FLJ20694 (Accession NM_017928) is another VGAM2463 host target gene. FLJ20694 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20694 BINDING SITE, designated SEQ ID:19608, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83381] Another function of VGAM2463 is therefore inhibition of FLJ20694 (Accession NM_017928). Accordingly, utilities of

VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20694. FLJ21596 (Accession NM_024823) is another VGAM2463 host target gene. FLJ21596 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21596 BINDING SITE, designated SEQ ID:24212, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83382] Another function of VGAM2463 is therefore inhibition of FLJ21596 (Accession NM_024823). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21596. FLJ22551 (Accession NM_024708) is another VGAM2463 host target gene. FLJ22551 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22551, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22551

BINDING SITE, designated SEQ ID:24027, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83383] Another function of VGAM2463 is therefore inhibition of FLJ22551 (Accession NM_024708). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22551. FLJ22679 (Accession NM_032227) is another VGAM2463 host target gene. FLJ22679 BINDING SITE1 and FLJ22679 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ22679, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22679 BINDING SITE1 and FLJ22679 BINDING SITE2, designated SEQ ID:25951 and SEQ ID:19264 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83384] Another function of VGAM2463 is therefore inhibition of FLJ22679 (Accession NM_032227). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22679. FLJ23537 (Accession NM_024889) is another VGAM2463 host target gene. FLJ23537 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23537 BINDING SITE, designated SEQ ID:24364, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83385] Another function of VGAM2463 is therefore inhibition of FLJ23537 (Accession NM_024889). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23537. FLJ23563 (Accession XM_041701) is another VGAM2463 host target gene. FLJ23563 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23563 BINDING SITE, designated SEQ ID:33564, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM

RNA, also designated SEQ ID:5174.

[83386] Another function of VGAM2463 is therefore inhibition of FLJ23563 (Accession XM_041701). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23563. FLJ31952 (Accession NM_144682) is another VGAM2463 host target gene. FLJ31952 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ31952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31952 BINDING SITE, designated SEQ ID:29499, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83387] Another function of VGAM2463 is therefore inhibition of FLJ31952 (Accession NM_144682). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31952. FLJ32389 (Accession NM_144617) is another VGAM2463 host target gene. FLJ32389 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32389, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32389 BINDING SITE, designated SEQ ID:29434, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83388] Another function of VGAM2463 is therefore inhibition of FLJ32389 (Accession NM_144617). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32389. FLJ32884 (Accession NM_144702) is another VGAM2463 host target gene. FLJ32884 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ32884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32884 BINDING SITE, designated SEQ ID:29527, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83389] Another function of VGAM2463 is therefore inhibition of FLJ32884 (Accession NM_144702). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ32884. Frequenin Homolog (Drosophila) (FREQ, Accession NM_014286) is another VGAM2463 host target gene. FREQ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FREQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FREQ BINDING SITE, designated SEQ ID:15563, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83390] Another function of VGAM2463 is therefore inhibition of Frequenin Homolog (Drosophila) (FREQ, Accession NM_014286). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FREQ. GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568) is another VGAM2463 host target gene. GABARAPL3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GABARAPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of GABARAPL3 BINDING SITE, designated SEQ ID:26299, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83391] Another function of VGAM2463 is therefore inhibition of GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL3. Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM_001470) is another VGAM2463 host target gene. GABBR1 BINDING SITE1 and GABBR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GABBR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE1 and GABBR1 BINDING SITE2, designated SEQ ID:7205 and SEQ ID:22422 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83392] Another function of VGAM2463 is therefore inhibition of

Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM_001470). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1. G Protein Pathway Suppressor 2 (GPS2, Accession XM_102749) is another VGAM2463 host target gene. GPS2 BINDING SITE1 and GPS2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GPS2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPS2 BINDING SITE1 and GPS2 BINDING SITE2, designated SEQ ID:42148 and SEQ ID:10826 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83393] Another function of VGAM2463 is therefore inhibition of G Protein Pathway Suppressor 2 (GPS2, Accession XM_102749). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPS2. GS3955 (Accession NM_021643) is another VGAM2463 host target gene. GS3955 BINDING SITE is HOST TARGET binding site found

in the 5` untranslated region of mRNA encoded by GS3955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GS3955 BINDING SITE, designated SEQ ID:22302, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83394] Another function of VGAM2463 is therefore inhibition of GS3955 (Accession NM_021643). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GS3955. Histidyl-tRNA Synthetase 2 (HARS2, Accession NM_080820) is another VGAM2463 host target gene. HARS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HARS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HARS2 BINDING SITE, designated SEQ ID:28079, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83395] Another function of VGAM2463 is therefore inhibition of Histidyl-tRNA Synthetase 2 (HARS2, Accession NM_080820). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HARS2. Hypocretin (orexin) Receptor 1 (HCRTR1, Accession NM_001525) is another VGAM2463 host target gene. HCRTR1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HCRTR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCRTR1 BINDING SITE, designated SEQ ID:7263, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83396] Another function of VGAM2463 is therefore inhibition of Hypocretin (orexin) Receptor 1 (HCRTR1, Accession NM_001525). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCRTR1. Hect Domain and RLD 3 (HERC3, Accession NM_014606) is another VGAM2463 host target gene. HERC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by HERC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HERC3 BINDING SITE, designated SEQ ID:15972, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83397] Another function of VGAM2463 is therefore inhibition of Hect Domain and RLD 3 (HERC3, Accession NM_014606). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HERC3. Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM_014571) is another VGAM2463 host target gene. HEYL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEYL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEYL BINDING SITE, designated SEQ ID:15930, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83398] Another function of VGAM2463 is therefore inhibition of

Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM_014571). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEYL. HNT (Accession NM_016522) is another VGAM2463 host target gene. HNT BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HNT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNT BINDING SITE, designated SEQ ID:18594, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83399] Another function of VGAM2463 is therefore inhibition of HNT (Accession NM_016522). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNT. HRIHFB2122 (Accession NM_007032) is another VGAM2463 host target gene. HRIHFB2122 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRIHFB2122, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRI-HFB2122 BINDING SITE, designated SEQ ID:13900, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83400] Another function of VGAM2463 is therefore inhibition of HRIHFB2122 (Accession NM_007032). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRIHFB2122. Integrin, Alpha 10 (ITGA10, Accession XM_002097) is another VGAM2463 host target gene. ITGA10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA10 BINDING SITE, designated SEQ ID:29862, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83401] Another function of VGAM2463 is therefore inhibition of Integrin, Alpha 10 (ITGA10, Accession XM_002097). Accordingly, utilities of VGAM2463 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with ITGA10. KIAA0152 (Accession NM_014730) is another VGAM2463 host target gene. KIAA0152 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE, designated SEQ ID:16336, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83402] Another function of VGAM2463 is therefore inhibition of KIAA0152 (Accession NM_014730). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0152. KIAA0237 (Accession NM_014747) is another VGAM2463 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0237 BINDING SITE, designated SEQ ID:16451, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83403] Another function of VGAM2463 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0247 (Accession NM_014734) is another VGAM2463 host target gene. KIAA0247 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:16377, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83404] Another function of VGAM2463 is therefore inhibition of KIAA0247 (Accession NM_014734). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247. KIAA0256 (Accession XM_034905) is another VGAM2463 host target gene. KIAA0256 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0256, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0256 BINDING SITE, designated SEQ ID:32185, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83405] Another function of VGAM2463 is therefore inhibition of KIAA0256 (Accession XM_034905). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0256. KIAA0284 (Accession XM_032235) is another VGAM2463 host target gene. KIAA0284 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0284, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0284 BINDING SITE, designated SEQ ID:31619, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83406] Another function of VGAM2463 is therefore inhibition of

KIAA0284 (Accession XM_032235). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0284. KIAA0321 (Accession XM_031077) is another VGAM2463 host target gene. KIAA0321 BINDING SITE1 and KIAA0321 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0321, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0321 BINDING SITE1 and KIAA0321 BINDING SITE2, designated SEQ ID:31267 and SEQ ID:31268 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83407] Another function of VGAM2463 is therefore inhibition of KIAA0321 (Accession XM_031077). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0321. KIAA0450 (Accession NM_014638) is another VGAM2463 host target gene. KIAA0450 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0450, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:16031, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83408] Another function of VGAM2463 is therefore inhibition of KIAA0450 (Accession NM_014638). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450. KIAA0451 (Accession NM_014826) is another VGAM2463 host target gene. KIAA0451 BINDING SITE1 and KIAA0451 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0451, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0451 BINDING SITE1 and KIAA0451 BINDING SITE2, designated SEQ ID:16805 and SEQ ID:16810 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83409] Another function of VGAM2463 is therefore inhibition of

KIAA0451 (Accession NM_014826). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0451. KIAA0720 (Accession XM_030970) is another VGAM2463 host target gene. KIAA0720 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0720 BINDING SITE, designated SEQ ID:31238, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83410] Another function of VGAM2463 is therefore inhibition of KIAA0720 (Accession XM_030970). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0720. KIAA0775 (Accession NM_014726) is another VGAM2463 host target gene. KIAA0775 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0775 BINDING SITE, designated SEQ ID:16322, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83411] Another function of VGAM2463 is therefore inhibition of KIAA0775 (Accession NM_014726). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0775. KIAA0794 (Accession XM_087353) is another VGAM2463 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:39180, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83412] Another function of VGAM2463 is therefore inhibition of KIAA0794 (Accession XM_087353). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0794. KIAA0889 (Accession NM_015377) is another

VGAM2463 host target gene. KIAA0889 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:17679, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83413] Another function of VGAM2463 is therefore inhibition of KIAA0889 (Accession NM_015377). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0889. KIAA0937 (Accession XM_166213) is another VGAM2463 host target gene. KIAA0937 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0937 BINDING SITE, designated SEQ ID:44017, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83414] Another function of VGAM2463 is therefore inhibition of KIAA0937 (Accession XM_166213). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0937. KIAA0939 (Accession XM_030524) is another VGAM2463 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31062, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83415] Another function of VGAM2463 is therefore inhibition of KIAA0939 (Accession XM_030524). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. KIAA1042 (Accession NM_014965) is another VGAM2463 host target gene. KIAA1042 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1042, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1042 BINDING SITE, designated SEQ ID:17351, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83416] Another function of VGAM2463 is therefore inhibition of KIAA1042 (Accession NM_014965). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1042. KIAA1076 (Accession XM_037523) is another VGAM2463 host target gene. KIAA1076 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1076 BINDING SITE, designated SEQ ID:32640, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83417] Another function of VGAM2463 is therefore inhibition of KIAA1076 (Accession XM_037523). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1076. KIAA1138 (Accession XM_030721) is another VGAM2463 host target gene. KIAA1138 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1138 BINDING SITE, designated SEQ ID:31127, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83418] Another function of VGAM2463 is therefore inhibition of KIAA1138 (Accession XM_030721). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1138. KIAA1172 (Accession XM_047889) is another VGAM2463 host target gene. KIAA1172 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1172 BINDING SITE, designated SEQ ID:35077, to the nucleotide sequence of VGAM2463 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5174.

[83419] Another function of VGAM2463 is therefore inhibition of KIAA1172 (Accession XM_047889). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1172. KIAA1185 (Accession XM_031399) is another VGAM2463 host target gene. KIAA1185 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1185 BINDING SITE, designated SEQ ID:31371, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83420] Another function of VGAM2463 is therefore inhibition of KIAA1185 (Accession XM_031399). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1185. KIAA1193 (Accession XM_041843) is another VGAM2463 host target gene. KIAA1193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1193, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1193 BINDING SITE, designated SEQ ID:33582, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83421] Another function of VGAM2463 is therefore inhibition of KIAA1193 (Accession XM_041843). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193. KIAA1434 (Accession XM_045585) is another VGAM2463 host target gene. KIAA1434 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1434 BINDING SITE, designated SEQ ID:34489, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83422] Another function of VGAM2463 is therefore inhibition of KIAA1434 (Accession XM_045585). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1434. KIAA1538 (Accession XM_049474) is another VGAM2463 host target gene. KIAA1538 BINDING SITE1 through KIAA1538 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1538, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE1 through KIAA1538 BINDING SITE3, designated SEQ ID:35426, SEQ ID:35427 and SEQ ID:35428 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83423] Another function of VGAM2463 is therefore inhibition of KIAA1538 (Accession XM_049474). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. KIAA1656 (Accession XM_038022) is another VGAM2463 host target gene. KIAA1656 BINDING SITE1 and KIAA1656 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1656, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE1 and KIAA1656 BINDING SITE2, designated SEQ ID:32730 and SEQ ID:32731 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83424] Another function of VGAM2463 is therefore inhibition of KIAA1656 (Accession XM_038022). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. KIAA1775 (Accession NM_033100) is another VGAM2463 host target gene. KIAA1775 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1775 BINDING SITE, designated SEQ ID:26944, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83425] Another function of VGAM2463 is therefore inhibition of KIAA1775 (Accession NM_033100). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1775. KIAA1831 (Accession XM_033366) is another VGAM2463 host target gene. KIAA1831 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1831 BINDING SITE, designated SEQ ID:31904, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83426] Another function of VGAM2463 is therefore inhibition of KIAA1831 (Accession XM_033366). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1831. KIAA1855 (Accession XM_166453) is another VGAM2463 host target gene. KIAA1855 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1855 BINDING SITE, designated SEQ ID:44361, to the

nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83427] Another function of VGAM2463 is therefore inhibition of KIAA1855 (Accession XM_166453). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1855. KIAA1862 (Accession XM_044212) is another VGAM2463 host target gene. KIAA1862 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1862, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1862 BINDING SITE, designated SEQ ID:34175, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83428] Another function of VGAM2463 is therefore inhibition of KIAA1862 (Accession XM_044212). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1862. KIAA1904 (Accession XM_056282) is another VGAM2463 host target gene. KIAA1904 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE, designated SEQ ID:36381, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83429] Another function of VGAM2463 is therefore inhibition of KIAA1904 (Accession XM_056282). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904. KIAA1938 (Accession XM_166407) is another VGAM2463 host target gene. KIAA1938 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1938 BINDING SITE, designated SEQ ID:44280, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83430] Another function of VGAM2463 is therefore inhibition of KIAA1938 (Accession XM_166407). Accordingly, utilities

of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1938. KIAA1949 (Accession XM_175173) is another VGAM2463 host target gene. KIAA1949 BINDING SITE1 through KIAA1949 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1949, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1949 BINDING SITE1 through KIAA1949 BINDING SITE3, designated SEQ ID:46669, SEQ ID:46714 and SEQ ID:44210 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83431] Another function of VGAM2463 is therefore inhibition of KIAA1949 (Accession XM_175173). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1949. Leucine-rich Repeat LGI Family, Member 2 (LGI2, Accession NM_018176) is another VGAM2463 host target gene. LGI2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LGI2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGI2 BINDING SITE, designated SEQ ID:20001, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83432] Another function of VGAM2463 is therefore inhibition of Leucine-rich Repeat LGI Family, Member 2 (LGI2, Accession NM_018176). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGI2. LHPP (Accession NM_022126) is another VGAM2463 host target gene. LHPP BINDING SITE1 through LHPP BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LHPP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHPP BINDING SITE1 through LHPP BINDING SITE4, designated SEQ ID:22675, SEQ ID:22676, SEQ ID:22677 and SEQ ID:22679 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83433] Another function of VGAM2463 is therefore inhibition of LHPP (Accession NM_022126). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHPP. MGC10812 (Accession NM_031425) is another VGAM2463 host target gene. MGC10812 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC10812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10812 BINDING SITE, designated SEQ ID:25414, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83434] Another function of VGAM2463 is therefore inhibition of MGC10812 (Accession NM_031425). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10812. MGC10986 (Accession NM_030576) is another VGAM2463 host target gene. MGC10986 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC10986, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10986 BINDING SITE, designated SEQ ID:24951, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83435] Another function of VGAM2463 is therefore inhibition of MGC10986 (Accession NM_030576). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10986. MGC15854 (Accession NM_145029) is another VGAM2463 host target gene. MGC15854 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC15854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15854 BINDING SITE, designated SEQ ID:29643, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83436] Another function of VGAM2463 is therefore inhibition of MGC15854 (Accession NM_145029). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC15854. MGC16824 (Accession NM_020314) is another VGAM2463 host target gene. MGC16824 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC16824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16824 BINDING SITE, designated SEQ ID:21572, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83437] Another function of VGAM2463 is therefore inhibition of MGC16824 (Accession NM_020314). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16824. MGC20255 (Accession NM_052848) is another VGAM2463 host target gene. MGC20255 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC20255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20255 BINDING SITE, designated SEQ ID:27429, to the nucleotide sequence of VGAM2463 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5174.

[83438] Another function of VGAM2463 is therefore inhibition of MGC20255 (Accession NM_052848). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20255. MGC21621 (Accession NM_145015) is another VGAM2463 host target gene. MGC21621 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC21621, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21621 BINDING SITE, designated SEQ ID:29621, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83439] Another function of VGAM2463 is therefore inhibition of MGC21621 (Accession NM_145015). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21621. MGC2574 (Accession NM_024098) is another VGAM2463 host target gene. MGC2574 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2574, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2574 BINDING SITE, designated SEQ ID:23536, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83440] Another function of VGAM2463 is therefore inhibition of MGC2574 (Accession NM_024098). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2574. MGC2817 (Accession XM_046613) is another VGAM2463 host target gene. MGC2817 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2817 BINDING SITE, designated SEQ ID:34763, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83441] Another function of VGAM2463 is therefore inhibition of MGC2817 (Accession XM_046613). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC2817. MGC4342 (Accession NM_024329) is another VGAM2463 host target gene. MGC4342 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4342 BINDING SITE, designated SEQ ID:23624, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83442] Another function of VGAM2463 is therefore inhibition of MGC4342 (Accession NM_024329). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4342. Neuroblastoma, Suppression of Tumorigenicity 1 (NBL1, Accession XM_001434) is another VGAM2463 host target gene. NBL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBL1 BINDING SITE, designated

SEQ ID:29839, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83443] Another function of VGAM2463 is therefore inhibition of Neuroblastoma, Suppression of Tumorigenicity 1 (NBL1, Accession XM_001434). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBL1. NFASC (Accession XM_046808) is another VGAM2463 host target gene. NFASC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NFASC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFASC BINDING SITE, designated SEQ ID:34831, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83444] Another function of VGAM2463 is therefore inhibition of NFASC (Accession XM_046808). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFASC. Nuclear Factor of Activated T-cells 5, Tonicity-responsive

(NFAT5, Accession NM_138714) is another VGAM2463 host target gene. NFAT5 BINDING SITE1 and NFAT5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NFAT5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFAT5 BINDING SITE1 and NFAT5 BINDING SITE2, designated SEQ ID:28954 and SEQ ID:28958 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83445] Another function of VGAM2463 is therefore inhibition of Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM_138714). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5. NTT73 (Accession NM_018057) is another VGAM2463 host target gene. NTT73 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NTT73, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTT73 BINDING SITE, des-

ignated SEQ ID:19825, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83446] Another function of VGAM2463 is therefore inhibition of NTT73 (Accession NM_018057). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTT73. Nucleoredoxin (NXN, Accession NM_022463) is another VGAM2463 host target gene. NXN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXN BINDING SITE, designated SEQ ID:22809, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83447] Another function of VGAM2463 is therefore inhibition of Nucleoredoxin (NXN, Accession NM_022463). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXN. Ornithine Decarboxylase Antizyme 3 (OAZ3, Accession NM_016178) is another VGAM2463 host target

gene. OAZ3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by OAZ3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAZ3 BINDING SITE, designated SEQ ID:18280, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83448] Another function of VGAM2463 is therefore inhibition of Ornithine Decarboxylase Antizyme 3 (OAZ3, Accession NM_016178). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAZ3. Prefoldin 1 (PFDN1, Accession NM_002622) is another VGAM2463 host target gene. PFDN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PFDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFDN1 BINDING SITE, designated SEQ ID:8483, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83449] Another function of VGAM2463 is therefore inhibition of Prefoldin 1 (PFDN1, Accession NM_002622). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFDN1. PIF1 (Accession XM_027898) is another VGAM2463 host target gene. PIF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIF1 BINDING SITE, designated SEQ ID:30586, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83450] Another function of VGAM2463 is therefore inhibition of PIF1 (Accession XM_027898). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIF1. Phospholipase A2, Group III (PLA2G3, Accession NM_015715) is another VGAM2463 host target gene. PLA2G3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PLA2G3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G3 BINDING SITE, designated SEQ ID:17928, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83451] Another function of VGAM2463 is therefore inhibition of Phospholipase A2, Group III (PLA2G3, Accession NM_015715). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G3. POLD3 (Accession XM_166243) is another VGAM2463 host target gene. POLD3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POLD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLD3 BINDING SITE, designated SEQ ID:44056, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83452] Another function of VGAM2463 is therefore inhibition of POLD3 (Accession XM_166243). Accordingly, utilities of

VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLD3. PP3501 (Accession NM_021731) is another VGAM2463 host target gene. PP3501 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PP3501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP3501 BINDING SITE, designated SEQ ID:22332, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83453] Another function of VGAM2463 is therefore inhibition of PP3501 (Accession NM_021731). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP3501. PR Domain Containing 11 (PRDM11, Accession NM_020229) is another VGAM2463 host target gene. PRDM11 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRDM11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PRDM11 BINDING SITE, designated SEQ ID:21501, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83454] Another function of VGAM2463 is therefore inhibition of PR Domain Containing 11 (PRDM11, Accession NM_020229). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM11. PR Domain Containing 7 (PRDM7, Accession NM_052996) is another VGAM2463 host target gene. PRDM7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRDM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM7 BINDING SITE, designated SEQ ID:27569, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83455] Another function of VGAM2463 is therefore inhibition of PR Domain Containing 7 (PRDM7, Accession NM_052996). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with PRDM7. PRO0233 (Accession NM_014121) is another VGAM2463 host target gene. PRO0233 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO0233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0233 BINDING SITE, designated SEQ ID:15373, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83456] Another function of VGAM2463 is therefore inhibition of PRO0233 (Accession NM_014121). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0233. PRO1048 (Accession NM_018497) is another VGAM2463 host target gene. PRO1048 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO1048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1048 BINDING SITE, designated SEQ ID:20557, to the nucleotide

sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83457] Another function of VGAM2463 is therefore inhibition of PRO1048 (Accession NM_018497). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1048. Protein Tyrosine Phosphatase, Non-receptor Type 3 (PTPN3, Accession NM_002829) is another VGAM2463 host target gene. PTPN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN3 BINDING SITE, designated SEQ ID:8706, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83458] Another function of VGAM2463 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 3 (PTPN3, Accession NM_002829). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN3. RAB40C, Member RAS Oncogene Family (RAB40C, Acces-

sion NM_021168) is another VGAM2463 host target gene. RAB40C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB40C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40C BINDING SITE, designated SEQ ID:22147, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83459] Another function of VGAM2463 is therefore inhibition of RAB40C, Member RAS Oncogene Family (RAB40C, Accession NM_021168). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40C. RAB6B, Member RAS Oncogene Family (RAB6B, Accession NM_016577) is another VGAM2463 host target gene. RAB6B BINDING SITE1 and RAB6B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAB6B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB6B BINDING SITE1 and RAB6B BINDING

SITE2, designated SEQ ID:18653 and SEQ ID:18654 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83460] Another function of VGAM2463 is therefore inhibition of RAB6B, Member RAS Oncogene Family (RAB6B, Accession NM_016577). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB6B. RBPMS (Accession NM_006867) is another VGAM2463 host target gene. RBPMS BINDING SITE1 and RBPMS BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RBPMS, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBPMS BINDING SITE1 and RBPMS BINDING SITE2, designated SEQ ID:13738 and SEQ ID:8824 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83461] Another function of VGAM2463 is therefore inhibition of RBPMS (Accession NM_006867). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with RBPMS. SAE1 (Accession NM_005500) is another VGAM2463 host target gene. SAE1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SAE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAE1 BINDING SITE, designated SEQ ID:12004, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83462] Another function of VGAM2463 is therefore inhibition of SAE1 (Accession NM_005500). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAE1. SARM (Accession NM_015077) is another VGAM2463 host target gene. SARM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SARM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SARM BINDING SITE, designated SEQ ID:17458, to the nucleotide sequence of VGAM2463 RNA,

herein designated VGAM RNA, also designated SEQ ID:5174.

[83463] Another function of VGAM2463 is therefore inhibition of SARM (Accession NM_015077). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARM. SCAMP5 (Accession NM_138967) is another VGAM2463 host target gene. SCAMP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCAMP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP5 BINDING SITE, designated SEQ ID:29075, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83464] Another function of VGAM2463 is therefore inhibition of SCAMP5 (Accession NM_138967). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP5. SCYA22 (Accession XM_165651) is another VGAM2463 host target gene. SCYA22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by SCYA22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYA22 BINDING SITE, designated SEQ ID:43715, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83465] Another function of VGAM2463 is therefore inhibition of SCYA22 (Accession XM_165651). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA22. Solute Carrier Family 38, Member 5 (SLC38A5, Accession NM_033518) is another VGAM2463 host target gene. SLC38A5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC38A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC38A5 BINDING SITE, designated SEQ ID:27298, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83466] Another function of VGAM2463 is therefore inhibition of

Solute Carrier Family 38, Member 5 (SLC38A5, Accession NM_033518). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A5. Syntaphilin (SNPH, Accession NM_014723) is another VGAM2463 host target gene. SNPH BINDING SITE1 through SNPH BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SNPH, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE1 through SNPH BINDING SITE3, designated SEQ ID:16294, SEQ ID:16297 and SEQ ID:16298 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83467] Another function of VGAM2463 is therefore inhibition of Syntaphilin (SNPH, Accession NM_014723). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. SPBPBP (Accession NM_006692) is another VGAM2463 host target gene. SPBPBP BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by SPBPBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPBPBP BINDING SITE, designated SEQ ID:13510, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83468] Another function of VGAM2463 is therefore inhibition of SPBPBP (Accession NM_006692). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPBPBP. SPEC1 (Accession NM_020239) is another VGAM2463 host target gene. SPEC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPEC1 BINDING SITE, designated SEQ ID:21516, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83469] Another function of VGAM2463 is therefore inhibition of SPEC1 (Accession NM_020239). Accordingly, utilities of

VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPEC1. Serine Protease Inhibitor, Kunitz Type 1 (SPINT1, Accession XM_031510) is another VGAM2463 host target gene. SPINT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPINT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPINT1 BINDING SITE, designated SEQ ID:31392, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83470] Another function of VGAM2463 is therefore inhibition of Serine Protease Inhibitor, Kunitz Type 1 (SPINT1, Accession XM_031510). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPINT1. SSH2 (Accession XM_030846) is another VGAM2463 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31182, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83471] Another function of VGAM2463 is therefore inhibition of SSH2 (Accession XM_030846). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. TCF-3 (Accession NM_031283) is another VGAM2463 host target gene. TCF-3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TCF-3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF-3 BINDING SITE, designated SEQ ID:25306, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83472] Another function of VGAM2463 is therefore inhibition of TCF-3 (Accession NM_031283). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF-3. Translocation Protein 1 (TLOC1, Accession NM_003262) is

another VGAM2463 host target gene. TLOC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TLOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLOC1 BINDING SITE, designated SEQ ID:9273, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83473] Another function of VGAM2463 is therefore inhibition of Translocation Protein 1 (TLOC1, Accession NM_003262). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLOC1. Tankyrase 1 Binding Protein 1, 182kDa (TNKS1BP1, Accession NM_033396) is another VGAM2463 host target gene. TNKS1BP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TNKS1BP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNKS1BP1 BINDING SITE, designated SEQ ID:27224, to the nucleotide sequence of VGAM2463 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5174.

[83474] Another function of VGAM2463 is therefore inhibition of Tankyrase 1 Binding Protein 1, 182kDa (TNKS1BP1, Accession NM_033396). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNKS1BP1. Trinucleotide Repeat Containing 4 (TNRC4, Accession NM_007185) is another VGAM2463 host target gene. TNRC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNRC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNRC4 BINDING SITE, designated SEQ ID:14041, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83475] Another function of VGAM2463 is therefore inhibition of Trinucleotide Repeat Containing 4 (TNRC4, Accession NM_007185). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC4. TOLLIP (Accession NM_019009) is another VGAM2463 host target gene.

TOLLIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOLLIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOLLIP BINDING SITE, designated SEQ ID:21092, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83476] Another function of VGAM2463 is therefore inhibition of TOLLIP (Accession NM_019009). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOLLIP. Target of Myb1 (chicken) (TOM1, Accession NM_005488) is another VGAM2463 host target gene. TOM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOM1 BINDING SITE, designated SEQ ID:11986, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83477] Another function of VGAM2463 is therefore inhibition of Target of Myb1 (chicken) (TOM1, Accession NM_005488). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOM1. Torsin Family 2, Member A (TOR2A, Accession NM_130459) is another VGAM2463 host target gene. TOR2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOR2A BINDING SITE, designated SEQ ID:28221, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83478] Another function of VGAM2463 is therefore inhibition of Torsin Family 2, Member A (TOR2A, Accession NM_130459). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOR2A. TSC22 (Accession NM_006022) is another VGAM2463 host target gene. TSC22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TSC22,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSC22 BINDING SITE, designated SEQ ID:12640, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83479] Another function of VGAM2463 is therefore inhibition of TSC22 (Accession NM_006022). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSC22. Tweety Homolog 2 (Drosophila) (TTYH2, Accession NM_032646) is another VGAM2463 host target gene. TTYH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TTYH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTYH2 BINDING SITE, designated SEQ ID:26378, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83480] Another function of VGAM2463 is therefore inhibition of

Tweety Homolog 2 (Drosophila) (TTYH2, Accession NM_032646). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTYH2. TUSP (Accession NM_020245) is another VGAM2463 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21528, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83481] Another function of VGAM2463 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. Vav 3 Oncogene (VAV3, Accession NM_006113) is another VGAM2463 host target gene. VAV3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VAV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of VAV3 BINDING SITE, designated SEQ ID:12760, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83482] Another function of VGAM2463 is therefore inhibition of Vav 3 Oncogene (VAV3, Accession NM_006113). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAV3. Zinc Finger Protein 95 Homolog (mouse) (ZFP95, Accession NM_014569) is another VGAM2463 host target gene. ZFP95 BINDING SITE1 and ZFP95 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZFP95, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP95 BINDING SITE1 and ZFP95 BINDING SITE2, designated SEQ ID:15921 and SEQ ID:29711 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83483] Another function of VGAM2463 is therefore inhibition of Zinc Finger Protein 95 Homolog (mouse) (ZFP95, Accession NM_014569). Accordingly, utilities of VGAM2463 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP95. LOC115509 (Accession XM_056092) is another VGAM2463 host target gene. LOC115509 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115509 BINDING SITE, designated SEQ ID:36363, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83484] Another function of VGAM2463 is therefore inhibition of LOC115509 (Accession XM_056092). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115509. LOC123242 (Accession XM_063548) is another VGAM2463 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC123242 BINDING SITE, designated SEQ ID:37244, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83485] Another function of VGAM2463 is therefore inhibition of LOC123242 (Accession XM_063548). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123242. LOC124753 (Accession XM_058837) is another VGAM2463 host target gene. LOC124753 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC124753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124753 BINDING SITE, designated SEQ ID:36761, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83486] Another function of VGAM2463 is therefore inhibition of LOC124753 (Accession XM_058837). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124753. LOC126208 (Accession XM_058999) is another VGAM2463 host target gene. LOC126208 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126208, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126208 BINDING SITE, designated SEQ ID:36815, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83487] Another function of VGAM2463 is therefore inhibition of LOC126208 (Accession XM_058999). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126208. LOC127703 (Accession XM_059172) is another VGAM2463 host target gene. LOC127703 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC127703, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127703 BINDING SITE, designated SEQ ID:36907, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83488] Another function of VGAM2463 is therefore inhibition of

LOC127703 (Accession XM_059172). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127703. LOC128077 (Accession XM_059208) is another VGAM2463 host target gene. LOC128077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC128077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128077 BINDING SITE, designated SEQ ID:36918, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83489] Another function of VGAM2463 is therefore inhibition of LOC128077 (Accession XM_059208). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128077. LOC132671 (Accession NM_145263) is another VGAM2463 host target gene. LOC132671 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC132671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC132671 BINDING SITE, designated SEQ ID:29777, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83490] Another function of VGAM2463 is therefore inhibition of LOC132671 (Accession NM_145263). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132671. LOC136288 (Accession XM_059832) is another VGAM2463 host target gene. LOC136288 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC136288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC136288 BINDING SITE, designated SEQ ID:37099, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83491] Another function of VGAM2463 is therefore inhibition of LOC136288 (Accession XM_059832). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136288. LOC145371 (Accession XM_085123) is an-

other VGAM2463 host target gene. LOC145371 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145371 BINDING SITE, designated SEQ ID:37846, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83492] Another function of VGAM2463 is therefore inhibition of LOC145371 (Accession XM_085123). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145371. LOC145988 (Accession XM_085290) is another VGAM2463 host target gene. LOC145988 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145988 BINDING SITE, designated SEQ ID:38042, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83493] Another function of VGAM2463 is therefore inhibition of LOC145988 (Accession XM_085290). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145988. LOC146237 (Accession XM_096954) is another VGAM2463 host target gene. LOC146237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146237 BINDING SITE, designated SEQ ID:40666, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83494] Another function of VGAM2463 is therefore inhibition of LOC146237 (Accession XM_096954). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146237. LOC146488 (Accession XM_047748) is another VGAM2463 host target gene. LOC146488 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146488, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146488 BINDING SITE, designated SEQ ID:35046, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83495] Another function of VGAM2463 is therefore inhibition of LOC146488 (Accession XM_047748). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146488. LOC146780 (Accession XM_097086) is another VGAM2463 host target gene. LOC146780 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146780, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146780 BINDING SITE, designated SEQ ID:40741, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83496] Another function of VGAM2463 is therefore inhibition of LOC146780 (Accession XM_097086). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146780. LOC146957 (Accession XM_085652) is another VGAM2463 host target gene. LOC146957 BINDING SITE1 and LOC146957 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC146957, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146957 BINDING SITE1 and LOC146957 BINDING SITE2, designated SEQ ID:38278 and SEQ ID:38279 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83497] Another function of VGAM2463 is therefore inhibition of LOC146957 (Accession XM_085652). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146957. LOC148946 (Accession XM_097557) is another VGAM2463 host target gene. LOC148946 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC148946 BINDING SITE, designated SEQ ID:40939, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83498] Another function of VGAM2463 is therefore inhibition of LOC148946 (Accession XM_097557). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148946. LOC149684 (Accession XM_097710) is another VGAM2463 host target gene. LOC149684 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149684, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149684 BINDING SITE, designated SEQ ID:41048, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83499] Another function of VGAM2463 is therefore inhibition of LOC149684 (Accession XM_097710). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149684. LOC149912 (Accession XM_097743) is another VGAM2463 host target gene. LOC149912 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149912 BINDING SITE, designated SEQ ID:41086, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83500] Another function of VGAM2463 is therefore inhibition of LOC149912 (Accession XM_097743). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149912. LOC151174 (Accession XM_098013) is another VGAM2463 host target gene. LOC151174 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151174 BINDING SITE, designated SEQ ID:41312, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83501] Another function of VGAM2463 is therefore inhibition of

LOC151174 (Accession XM_098013). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151174. LOC151201 (Accession XM_098021) is another VGAM2463 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:41328, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83502] Another function of VGAM2463 is therefore inhibition of LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. LOC151473 (Accession XM_087215) is another VGAM2463 host target gene. LOC151473 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC151473 BINDING SITE, designated SEQ ID:39119, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83503] Another function of VGAM2463 is therefore inhibition of LOC151473 (Accession XM_087215). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151473. LOC151516 (Accession XM_087229) is another VGAM2463 host target gene. LOC151516 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151516 BINDING SITE, designated SEQ ID:39128, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83504] Another function of VGAM2463 is therefore inhibition of LOC151516 (Accession XM_087229). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151516. LOC151657 (Accession XM_098100) is an-

other VGAM2463 host target gene. LOC151657 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151657 BINDING SITE, designated SEQ ID:41382, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83505] Another function of VGAM2463 is therefore inhibition of LOC151657 (Accession XM_098100). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151657. LOC151904 (Accession XM_087334) is another VGAM2463 host target gene. LOC151904 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151904 BINDING SITE, designated SEQ ID:39173, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83506] Another function of VGAM2463 is therefore inhibition of LOC151904 (Accession XM_087334). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151904. LOC153688 (Accession XM_098416) is another VGAM2463 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:41659, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83507] Another function of VGAM2463 is therefore inhibition of LOC153688 (Accession XM_098416). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688. LOC154877 (Accession XM_098626) is another VGAM2463 host target gene. LOC154877 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154877, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:41743, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83508] Another function of VGAM2463 is therefore inhibition of LOC154877 (Accession XM_098626). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877. LOC157349 (Accession XM_088298) is another VGAM2463 host target gene. LOC157349 BINDING SITE1 and LOC157349 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC157349, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE1 and LOC157349 BINDING SITE2, designated SEQ ID:39593 and SEQ ID:39595 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83509] Another function of VGAM2463 is therefore inhibition of LOC157349 (Accession XM_088298). Accordingly, utilities

of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349. LOC157918 (Accession XM_098842) is another VGAM2463 host target gene. LOC157918 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157918 BINDING SITE, designated SEQ ID:41896, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83510] Another function of VGAM2463 is therefore inhibition of LOC157918 (Accession XM_098842). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157918. LOC157919 (Accession XM_088420) is another VGAM2463 host target gene. LOC157919 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC157919 BINDING SITE, designated SEQ ID:39683, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83511] Another function of VGAM2463 is therefore inhibition of LOC157919 (Accession XM_088420). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157919. LOC158187 (Accession XM_098892) is another VGAM2463 host target gene. LOC158187 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158187 BINDING SITE, designated SEQ ID:41923, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83512] Another function of VGAM2463 is therefore inhibition of LOC158187 (Accession XM_098892). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158187. LOC158235 (Accession XM_098897) is another VGAM2463 host target gene. LOC158235 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158235 BINDING SITE, designated SEQ ID:41924, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83513] Another function of VGAM2463 is therefore inhibition of LOC158235 (Accession XM_098897). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158235. LOC158288 (Accession XM_098912) is another VGAM2463 host target gene. LOC158288 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158288 BINDING SITE, designated SEQ ID:41929, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83514] Another function of VGAM2463 is therefore inhibition of

LOC158288 (Accession XM_098912). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158288. LOC165721 (Accession XM_093388) is another VGAM2463 host target gene. LOC165721 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC165721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165721 BINDING SITE, designated SEQ ID:40191, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83515] Another function of VGAM2463 is therefore inhibition of LOC165721 (Accession XM_093388). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165721. LOC165741 (Accession XM_105272) is another VGAM2463 host target gene. LOC165741 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC165741, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC165741 BINDING SITE, designated SEQ ID:42191, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83516] Another function of VGAM2463 is therefore inhibition of LOC165741 (Accession XM_105272). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165741. LOC196463 (Accession XM_113725) is another VGAM2463 host target gene. LOC196463 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196463 BINDING SITE, designated SEQ ID:42374, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83517] Another function of VGAM2463 is therefore inhibition of LOC196463 (Accession XM_113725). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196463. LOC196955 (Accession XM_085210) is an-

other VGAM2463 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37936, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83518] Another function of VGAM2463 is therefore inhibition of LOC196955 (Accession XM_085210). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC200010 (Accession XM_117174) is another VGAM2463 host target gene. LOC200010 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200010 BINDING SITE, designated SEQ ID:43278, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83519] Another function of VGAM2463 is therefore inhibition of LOC200010 (Accession XM_117174). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200010. LOC200269 (Accession XM_114175) is another VGAM2463 host target gene. LOC200269 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200269, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200269 BINDING SITE, designated SEQ ID:42760, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83520] Another function of VGAM2463 is therefore inhibition of LOC200269 (Accession XM_114175). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200269. LOC201245 (Accession XM_113326) is another VGAM2463 host target gene. LOC201245 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201245, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201245 BINDING SITE, designated SEQ ID:42230, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83521] Another function of VGAM2463 is therefore inhibition of LOC201245 (Accession XM_113326). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201245. LOC201294 (Accession XM_113950) is another VGAM2463 host target gene. LOC201294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201294 BINDING SITE, designated SEQ ID:42567, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83522] Another function of VGAM2463 is therefore inhibition of LOC201294 (Accession XM_113950). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC201294. LOC201562 (Accession XM_114343) is another VGAM2463 host target gene. LOC201562 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201562 BINDING SITE, designated SEQ ID:42883, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83523] Another function of VGAM2463 is therefore inhibition of LOC201562 (Accession XM_114343). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201562. LOC201702 (Accession XM_114365) is another VGAM2463 host target gene. LOC201702 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201702 BINDING SITE, designated SEQ ID:42901, to the nucleotide sequence of VGAM2463 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5174.

[83524] Another function of VGAM2463 is therefore inhibition of LOC201702 (Accession XM_114365). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201702. LOC203248 (Accession XM_114659) is another VGAM2463 host target gene. LOC203248 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203248 BINDING SITE, designated SEQ ID:43020, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83525] Another function of VGAM2463 is therefore inhibition of LOC203248 (Accession XM_114659). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203248. LOC203504 (Accession XM_117550) is another VGAM2463 host target gene. LOC203504 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203504, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203504 BINDING SITE, designated SEQ ID:43571, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83526] Another function of VGAM2463 is therefore inhibition of LOC203504 (Accession XM_117550). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203504. LOC219540 (Accession XM_168047) is another VGAM2463 host target gene. LOC219540 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219540 BINDING SITE, designated SEQ ID:44958, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83527] Another function of VGAM2463 is therefore inhibition of LOC219540 (Accession XM_168047). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC219540. LOC219654 (Accession XM_166095) is another VGAM2463 host target gene. LOC219654 BINDING SITE1 and LOC219654 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC219654, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219654 BINDING SITE1 and LOC219654 BINDING SITE2, designated SEQ ID:43875 and SEQ ID:43877 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83528] Another function of VGAM2463 is therefore inhibition of LOC219654 (Accession XM_166095). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219654. LOC219688 (Accession XM_167568) is another VGAM2463 host target gene. LOC219688 BINDING SITE1 and LOC219688 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC219688, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219688 BINDING SITE1 and LOC219688 BINDING SITE2, designated SEQ ID:44699 and SEQ ID:43984 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83529] Another function of VGAM2463 is therefore inhibition of LOC219688 (Accession XM_167568). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219688. LOC221042 (Accession XM_167669) is another VGAM2463 host target gene. LOC221042 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221042 BINDING SITE, designated SEQ ID:44756, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83530] Another function of VGAM2463 is therefore inhibition of LOC221042 (Accession XM_167669). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC221042. LOC221474 (Accession XM_166464) is another VGAM2463 host target gene. LOC221474 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221474 BINDING SITE, designated SEQ ID:44380, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83531] Another function of VGAM2463 is therefore inhibition of LOC221474 (Accession XM_166464). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221474. LOC221683 (Accession XM_168089) is another VGAM2463 host target gene. LOC221683 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221683, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221683 BINDING SITE, designated SEQ ID:45004, to

the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83532] Another function of VGAM2463 is therefore inhibition of LOC221683 (Accession XM_168089). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221683. LOC221922 (Accession XM_166555) is another VGAM2463 host target gene. LOC221922 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221922 BINDING SITE, designated SEQ ID:44534, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83533] Another function of VGAM2463 is therefore inhibition of LOC221922 (Accession XM_166555). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221922. LOC253216 (Accession XM_170765) is another VGAM2463 host target gene. LOC253216 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC253216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253216 BINDING SITE, designated SEQ ID:45520, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83534] Another function of VGAM2463 is therefore inhibition of LOC253216 (Accession XM_170765). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253216. LOC253609 (Accession XM_172986) is another VGAM2463 host target gene. LOC253609 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253609 BINDING SITE, designated SEQ ID:46259, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83535] Another function of VGAM2463 is therefore inhibition of LOC253609 (Accession XM_172986). Accordingly, utilities

of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253609. LOC253715 (Accession XM_173053) is another VGAM2463 host target gene. LOC253715 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253715 BINDING SITE, designated SEQ ID:46311, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83536] Another function of VGAM2463 is therefore inhibition of LOC253715 (Accession XM_173053). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253715. LOC253805 (Accession XM_172854) is another VGAM2463 host target gene. LOC253805 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC253805 BINDING SITE, designated SEQ ID:46136, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83537] Another function of VGAM2463 is therefore inhibition of LOC253805 (Accession XM_172854). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253805. LOC254057 (Accession XM_173085) is another VGAM2463 host target gene. LOC254057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254057 BINDING SITE, designated SEQ ID:46348, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83538] Another function of VGAM2463 is therefore inhibition of LOC254057 (Accession XM_173085). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254057. LOC254532 (Accession XM_172961) is another VGAM2463 host target gene. LOC254532 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254532 BINDING SITE, designated SEQ ID:46210, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83539] Another function of VGAM2463 is therefore inhibition of LOC254532 (Accession XM_172961). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254532. LOC255040 (Accession XM_172837) is another VGAM2463 host target gene. LOC255040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255040 BINDING SITE, designated SEQ ID:46109, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83540] Another function of VGAM2463 is therefore inhibition of

LOC255040 (Accession XM_172837). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255040. LOC255041 (Accession XM_172838) is another VGAM2463 host target gene. LOC255041 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255041, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255041 BINDING SITE, designated SEQ ID:46112, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83541] Another function of VGAM2463 is therefore inhibition of LOC255041 (Accession XM_172838). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255041. LOC256267 (Accession XM_173007) is another VGAM2463 host target gene. LOC256267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC256267 BINDING SITE, designated SEQ ID:46278, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83542] Another function of VGAM2463 is therefore inhibition of LOC256267 (Accession XM_173007). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256267. LOC256846 (Accession XM_170921) is another VGAM2463 host target gene. LOC256846 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256846 BINDING SITE, designated SEQ ID:45697, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83543] Another function of VGAM2463 is therefore inhibition of LOC256846 (Accession XM_170921). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256846. LOC257106 (Accession XM_170910) is an-

other VGAM2463 host target gene. LOC257106 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257106 BINDING SITE, designated SEQ ID:45677, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83544] Another function of VGAM2463 is therefore inhibition of LOC257106 (Accession XM_170910). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257106. LOC51236 (Accession NM_016458) is another VGAM2463 host target gene. LOC51236 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51236 BINDING SITE, designated SEQ ID:18572, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83545] Another function of VGAM2463 is therefore inhibition of LOC51236 (Accession NM_016458). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51236. LOC51337 (Accession NM_016647) is another VGAM2463 host target gene. LOC51337 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51337 BINDING SITE, designated SEQ ID:18763, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83546] Another function of VGAM2463 is therefore inhibition of LOC51337 (Accession NM_016647). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51337. LOC57105 (Accession NM_020377) is another VGAM2463 host target gene. LOC57105 BINDING SITE1 and LOC57105 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC57105, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57105 BINDING SITE1 and LOC57105 BINDING SITE2, designated SEQ ID:21640 and SEQ ID:21642 respectively, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83547] Another function of VGAM2463 is therefore inhibition of LOC57105 (Accession NM_020377). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57105. LOC84548 (Accession XM_048904) is another VGAM2463 host target gene. LOC84548 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC84548, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84548 BINDING SITE, designated SEQ ID:35299, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83548] Another function of VGAM2463 is therefore inhibition of LOC84548 (Accession XM_048904). Accordingly, utilities

of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84548. LOC90072 (Accession XM_028702) is another VGAM2463 host target gene. LOC90072 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90072 BINDING SITE, designated SEQ ID:30729, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83549] Another function of VGAM2463 is therefore inhibition of LOC90072 (Accession XM_028702). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90072. LOC90288 (Accession XM_030669) is another VGAM2463 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90288 BINDING SITE, designated SEQ ID:31118, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83550] Another function of VGAM2463 is therefore inhibition of LOC90288 (Accession XM_030669). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. LOC90550 (Accession XM_054582) is another VGAM2463 host target gene. LOC90550 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90550 BINDING SITE, designated SEQ ID:36178, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83551] Another function of VGAM2463 is therefore inhibition of LOC90550 (Accession XM_054582). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90550. LOC90736 (Accession XM_033811) is another VGAM2463 host target gene. LOC90736 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90736, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90736 BINDING SITE, designated SEQ ID:31957, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83552] Another function of VGAM2463 is therefore inhibition of LOC90736 (Accession XM_033811). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90736. LOC90917 (Accession XM_034861) is another VGAM2463 host target gene. LOC90917 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90917 BINDING SITE, designated SEQ ID:32166, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83553] Another function of VGAM2463 is therefore inhibition of

LOC90917 (Accession XM_034861). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90917. LOC91397 (Accession XM_038219) is another VGAM2463 host target gene. LOC91397 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91397 BINDING SITE, designated SEQ ID:32780, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83554] Another function of VGAM2463 is therefore inhibition of LOC91397 (Accession XM_038219). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91397. LOC91960 (Accession XM_041872) is another VGAM2463 host target gene. LOC91960 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC91960 BINDING SITE, designated SEQ ID:33613, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83555] Another function of VGAM2463 is therefore inhibition of LOC91960 (Accession XM_041872). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91960. LOC92230 (Accession XM_043733) is another VGAM2463 host target gene. LOC92230 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92230, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92230 BINDING SITE, designated SEQ ID:34008, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83556] Another function of VGAM2463 is therefore inhibition of LOC92230 (Accession XM_043733). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92230. LOC92405 (Accession XM_044914) is another

VGAM2463 host target gene. LOC92405 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92405 BINDING SITE, designated SEQ ID:34304, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83557] Another function of VGAM2463 is therefore inhibition of LOC92405 (Accession XM_044914). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92405. LOC92466 (Accession XM_045251) is another VGAM2463 host target gene. LOC92466 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92466 BINDING SITE, designated SEQ ID:34397, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83558] Another function of VGAM2463 is therefore inhibition of LOC92466 (Accession XM_045251). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92466. LOC92710 (Accession XM_046811) is another VGAM2463 host target gene. LOC92710 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92710 BINDING SITE, designated SEQ ID:34835, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83559] Another function of VGAM2463 is therefore inhibition of LOC92710 (Accession XM_046811). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92710. LOC95702 (Accession XM_031446) is another VGAM2463 host target gene. LOC95702 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC95702, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC95702 BINDING SITE, designated SEQ ID:31383, to the nucleotide sequence of VGAM2463 RNA, herein designated VGAM RNA, also designated SEQ ID:5174.

[83560] Another function of VGAM2463 is therefore inhibition of LOC95702 (Accession XM_031446). Accordingly, utilities of VGAM2463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC95702. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2464 (VGAM2464) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83561] VGAM2464 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2464 was detected is described hereinabove with reference to Figs. 1-8.

[83562] VGAM2464 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2464 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[83563] VGAM2464 gene encodes a VGAM2464 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2464 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2464 precursor RNA is designated SEQ ID:2450, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2450 is located at position 225307 relative to the genome of Mouse Cytomegalovirus 1.

[83564] VGAM2464 precursor RNA folds onto itself, forming VGAM2464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83565] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2464 folded precursor RNA into VGAM2464

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2464 RNA is designated SEQ ID:5175, and is provided hereinbelow with reference to the sequence listing part.

[83566] VGAM2464 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2464 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2464 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83567] VGAM2464 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2464 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2464 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2464 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2464 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83568] The complementary binding of VGAM2464 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2464 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2464 host target RNA into VGAM2464 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[83569] It is appreciated that VGAM2464 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2464 host target genes. The mRNA of each one of this plurality of VGAM2464 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2464 RNA, herein designated VGAM RNA, and which when bound by VGAM2464 RNA causes inhibition of translation of respective one or more VGAM2464 host target proteins.

[83570] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2464 gene, herein designated VGAM GENE, on one or more VGAM2464 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83571] It is yet further appreciated that a function of VGAM2464 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2464 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2464 correlate with, and may be deduced from, the identity of the host target genes which VGAM2464 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83572] Nucleotide sequences of the VGAM2464 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2464 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2464 are further described hereinbelow with reference to Table 1.

[83573] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2464 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2464 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83574] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2464 gene, herein designated VGAM is inhibition of expression of VGAM2464 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2464 correlate with, and may be deduced from, the identity of the target genes which VGAM2464 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83575] B-cell CLL/lymphoma 7A (BCL7A, Accession NM_020993) is a VGAM2464 host target gene. BCL7A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7A BINDING SITE, designated SEQ ID:21986, to the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA, also designated SEQ ID:5175.

[83576] A function of VGAM2464 is therefore inhibition of B-cell CLL/lymphoma 7A (BCL7A, Accession NM_020993). Accordingly, utilities of VGAM2464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL7A. Hect Domain and RLD 2 (HERC2,

Accession NM_004667) is another VGAM2464 host target gene. HERC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HERC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HERC2 BINDING SITE, designated SEQ ID:11042, to the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA, also designated SEQ ID:5175.

[83577] Another function of VGAM2464 is therefore inhibition of Hect Domain and RLD 2 (HERC2, Accession NM_004667), a gene which may be a guanine nucleotide exchange factor involved in intracellular protein transport. Accordingly, utilities of VGAM2464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HERC2. The function of HERC2 has been established by previous studies. Prader-Willi syndrome (PWS; 176270) and Angelman syndrome (AS; 105830) result from deletions and loss of function of oppositely imprinted genes located within the proximal 2 Mb of the 15q11-q13 region. Low-copy repeat elements have been identified in the vicinity of the 3 deletion breakpoint hotspots using

molecular and cytologic methods. Using positional cloning from low-copy repeats flanking 15q11-q13, genomic sequence analysis, EST database searching, PCR, and long-range RT-PCR, Ji et al. (1999) obtained a cDNA encoding HERC2, which is identical to a partial cDNA, KIAA0393, identified by Nagase et al. (1997). Sequence analysis predicted that the 4,834-amino acid protein, which is 95% identical and 99% similar to the mouse protein, contains 3 RCC1-like domains (RLDs); a putative ZZ-type zinc finger motif with 6 conserved cysteines and 2 outlying histidine residues; a C-terminal HECT or E3 ubiquitin ligase (see OMIM Ref. No. UBE3A; 601623) domain; and several potential phosphorylation sites. The overall structure is similar to that of HERC1, although HERC1 has only 2 RLDs and no zinc finger motif. The C-terminal region of HERC2 resembles that of HERC3 (OMIM Ref. No. 605200). Northern blot analysis revealed ubiquitous expression of a 15.5-kb HERC2 transcript, with high levels in fetal tissues and adult skeletal muscle, heart, ovary, testis, and brain. Animal model experiments lend further support to the function of HERC2. The mouse Herc2 gene is located in the jdf2 (juvenile development and fertility-2) interval of chromosome 7C. Ji et al. (1999) identified splice junction

mutations in the Herc2 gene in chemically-induced jdf2 mutant alleles. The mutations led to exon skipping and premature termination, resulting in neuromuscular secretory vesicle defects, sperm acrosome defects, and juvenile lethality in jdf2 mice.

[83578] It is appreciated that the abovementioned animal model for HERC2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[83579] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83580] Ji, Y.; Walkowicz, M. J.; Buiting, K.; Johnson, D. K.; Tarvin, R. E.; Rinchik, E. M.; Horsthemke, B.; Stubbs, L.; Nicholls, R. D. : The ancestral gene for transcribed, low-copy repeats in the Prader-Willi/Angelman region encodes a large protein implicated in protein trafficking, which is deficient in mice with neuromuscular and spermiogenic abnormalities. Hum. Molec. Genet. 8: 533-542, 1999. ; and

[83581] Nagase, T.; Ishikawa, K.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes.

[83582] Further studies establishing the function and utilities of HERC2 are found in John Hopkins OMIM database record ID 605837, and in sited publications numbered 6435 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Integral Membrane Protein 2B (ITM2B, Accession NM_021999) is another VGAM2464 host target gene. ITM2B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ITM2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITM2B BINDING SITE, designated SEQ ID:22538, to the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA, also designated SEQ ID:5175.

[83583] Another function of VGAM2464 is therefore inhibition of Integral Membrane Protein 2B (ITM2B, Accession NM_021999), a gene which is a member of the type II integral membrane protein family. Accordingly, utilities of VGAM2464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITM2B. The function of ITM2B and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM458.DKFZp586I021 (Accession NM_032271) is another VGAM2464 host target gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DK-FZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp586I021 BINDING SITE, designated SEQ ID:26017, to the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA, also designated SEQ ID:5175.

[83584] Another function of VGAM2464 is therefore inhibition of DKFZp586I021 (Accession NM_032271). Accordingly, utilities of VGAM2464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586I021. KIAA1649 (Accession NM_032311) is another VGAM2464 host target gene. KIAA1649 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1649 BINDING SITE, designated SEQ ID:26108, to the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA, also designated SEQ ID:5175.

[83585] Another function of VGAM2464 is therefore inhibition of KIAA1649 (Accession NM_032311). Accordingly, utilities of VGAM2464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. KIAA1856 (Accession XM_166549) is another VGAM2464 host target gene. KIAA1856 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1856 BINDING SITE, designated SEQ ID:44525, to the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA, also designated SEQ ID:5175.

[83586] Another function of VGAM2464 is therefore inhibition of KIAA1856 (Accession XM_166549). Accordingly, utilities of VGAM2464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1856. MCF.2 Cell Line Derived Transforming Sequence-like (MCF2L, Accession XM_027516) is another

VGAM2464 host target gene. MCF2L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MCF2L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCF2L BINDING SITE, designated SEQ ID:30508, to the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA, also designated SEQ ID:5175.

[83587] Another function of VGAM2464 is therefore inhibition of MCF.2 Cell Line Derived Transforming Sequence-like (MCF2L, Accession XM_027516). Accordingly, utilities of VGAM2464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCF2L. MGC20235 (Accession NM_145041) is another VGAM2464 host target gene. MGC20235 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC20235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20235 BINDING SITE, designated SEQ ID:29668, to the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA,

also designated SEQ ID:5175.

[83588] Another function of VGAM2464 is therefore inhibition of MGC20235 (Accession NM_145041). Accordingly, utilities of VGAM2464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20235. WIT-1 (Accession NM_015855) is another VGAM2464 host target gene. WIT-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WIT-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WIT-1 BINDING SITE, designated SEQ ID:17990, to the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA, also designated SEQ ID:5175.

[83589] Another function of VGAM2464 is therefore inhibition of WIT-1 (Accession NM_015855). Accordingly, utilities of VGAM2464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WIT-1. LOC143888 (Accession XM_084669) is another VGAM2464 host target gene. LOC143888 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143888, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143888 BINDING SITE, designated SEQ ID:37670, to the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA, also designated SEQ ID:5175.

[83590] Another function of VGAM2464 is therefore inhibition of LOC143888 (Accession XM_084669). Accordingly, utilities of VGAM2464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143888. LOC147463 (Accession XM_085799) is another VGAM2464 host target gene. LOC147463 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147463 BINDING SITE, designated SEQ ID:38340, to the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA, also designated SEQ ID:5175.

[83591] Another function of VGAM2464 is therefore inhibition of LOC147463 (Accession XM_085799). Accordingly, utilities of VGAM2464 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC147463. LOC91695 (Accession XM_040084) is another VGAM2464 host target gene. LOC91695 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91695, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91695 BINDING SITE, designated SEQ ID:33252, to the nucleotide sequence of VGAM2464 RNA, herein designated VGAM RNA, also designated SEQ ID:5175.

[83592] Another function of VGAM2464 is therefore inhibition of LOC91695 (Accession XM_040084). Accordingly, utilities of VGAM2464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91695. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2465 (VGAM2465) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83593] VGAM2465 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2465 was detected is described hereinabove with reference to Figs. 1-8.

[83594] VGAM2465 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2465 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83595] VGAM2465 gene encodes a VGAM2465 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2465 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2465 precursor RNA is designated SEQ ID:2451, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2451 is located at position 161125 relative to the genome of Mouse Cytomegalovirus 1.

[83596] VGAM2465 precursor RNA folds onto itself, forming VGAM2465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83597] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2465 folded precursor RNA into VGAM2465 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2465 RNA is designated SEQ ID:5176, and is provided hereinbelow with reference to the sequence listing part.

[83598] VGAM2465 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2465 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2465 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83599] VGAM2465 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2465 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2465 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2465 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2465 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83600] The complementary binding of VGAM2465 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2465 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2465 host target RNA into VGAM2465 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83601] It is appreciated that VGAM2465 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2465 host target genes. The mRNA of each one of this plurality of VGAM2465 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2465 RNA, herein designated VGAM RNA, and which when bound by VGAM2465 RNA causes inhibition of translation of respective one or more VGAM2465 host target proteins.

[83602] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2465 gene, herein designated VGAM GENE, on one or more VGAM2465 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83603] It is yet further appreciated that a function of VGAM2465 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2465 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2465 correlate with, and may be deduced from, the identity of the host target genes which VGAM2465 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83604] Nucleotide sequences of the VGAM2465 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2465 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2465 are further described hereinbelow with reference to Table 1.

[83605] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2465 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2465 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83606] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2465 gene, herein designated VGAM is inhibition of expression of VGAM2465 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2465 correlate with, and may be deduced from, the identity of the target genes which VGAM2465 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83607] Proteoglycan 1, Secretory Granule (PRG1, Accession NM_002727) is a VGAM2465 host target gene. PRG1 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by PRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRG1 BINDING SITE, designated SEQ ID:8590, to the nucleotide sequence of VGAM2465 RNA, herein designated VGAM RNA, also designated SEQ ID:5176.

[83608] A function of VGAM2465 is therefore inhibition of Proteoglycan 1, Secretory Granule (PRG1, Accession NM_002727), a gene which protects cells from apoptosis induced by FAS or TNFA. Accordingly, utilities of VGAM2465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRG1. The function of PRG1 has been established by previous studies. Transcription factors of the nuclear factor-kappa-B/rel (NF-kappa-B) family (OMIM Ref. No. 164011) may be important in cell survival by regulating unidentified, anti-apoptotic genes. Charles et al. (1993) cloned gly96, a mouse immediate-early gene inducible by serum growth factors. Schafer et al. (1996) cloned the rat homolog, PRG1, which was induced in response to the pituitary adenylate cyclase-activating polypeptide (PACAP; 102980). Kondratyev et al. (1996) cloned the human im-

mediate-early gene IEX1. The cDNA encodes 156-amino acid polypeptide containing a single predicted transmembrane domain. On Northern blots, they observed a 1.2-kb mRNA whose expression could be induced by ionizing radiation, 12-O-tetradecanoylphorbol-13-acetate (TPA), okadaic acid, and TNF-alpha (OMIM Ref. No. 191160); these agents are all activators of the protein kinase C (PKC; OMIM Ref. No. 176960) pathway. Pietzsch et al. (1997) cloned the same human gene, which they termed DIF2. The expression of the DIF2 mRNA is downregulated during differentiation of macrophages and upregulated by lipopolysaccharide (LPS) stimulation of monocytes. Northern blot analysis revealed that DIF2 is expressed most abundantly in monocytes, lymphocytes, and keratinocytes, and at a lesser level in several other human tissues and cell lines. Wu et al. (1998) described a gene that protects cells from apoptosis induced by FAS (OMIM Ref. No. 134637) or TNFA. The gene appeared to be the same as the immediate-early response gene IEX1 reported by Kondratyev et al. (1996), Charles et al. (1993), and Schafer et al. (1996), except that it had an in-frame insertion of 111 nucleotides at position 211 of the coding region of IEX1, and could encode a longer polypeptide with a 37-amino

acid insertion relative to IEX1. The longer IEX1 (referred to as IEX1L; the original IEX1 was referred to as IEX1S) was found to be generated from IEX1 in the absence of RNA splicing as it contained the entire intron sequence of IEX1. The transcription of IEX1L induced by TNF was decreased in cells with defective NF-kappa-B activation, rendering them sensitive to TNF-induced apoptosis, which was abolished by transfection with IEX1L. In support, overexpression of antisense IEX1L partially blocked TNF-induced expression of IEX1L and sensitized normal cells to killing. This study demonstrated a key role of IEX1L in cellular resistance to TNF-induced apoptosis. Pietzsch et al. (1998) cloned the genomic DNA of the DIF2 gene. They found that the gene consists of 2 exons and a single small intron. The 5-prime flanking region of the gene contains binding sites for transcription factors including NF-kappa-B, CEBP (OMIM Ref. No. 116897), and SP1 (OMIM Ref. No. 189906). Pietzsch et al. (1998) used fluorescence in situ hybridization to map the IER3 gene to human chromosome 6p21.3.

[83609] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83610] Pietzsch, A.; Buchler, C.; Schmitz, G. : Genomic organization, promoter cloning, and chromosomal localization of the Dif-2 gene. Biochem. Biophys. Res. Commun. 245: 651-657, 1998. ; and

[83611] Wu, M. X.; Ao, Z.; Prasad, K. V. S.; Wu, R.; Schlossman, S. F. : IEX-1L, an apoptosis inhibitor involved in NF-kappa-B-mediated cell survival. Science 281: 998-1001, 1998.

[83612] Further studies establishing the function and utilities of PRG1 are found in John Hopkins OMIM database record ID 602996, and in sited publications numbered 5412-5417 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.BSPECV (Accession NM_016642) is another VGAM2465 host target gene. BSPECV BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BSPECV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSPECV BINDING SITE, designated SEQ ID:18747, to the nucleotide sequence of VGAM2465 RNA, herein designated VGAM RNA, also designated SEQ ID:5176.

[83613] Another function of VGAM2465 is therefore inhibition of BSPECV (Accession NM_016642). Accordingly, utilities of VGAM2465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BSPECV. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2466 (VGAM2466) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83614] VGAM2466 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2466 was detected is described hereinabove with reference to Figs. 1-8.

[83615] VGAM2466 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2466 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83616] VGAM2466 gene encodes a VGAM2466 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2466 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2466 precursor RNA is designated SEQ ID:2452, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2452 is located at position 94468 relative to the genome of Mouse Cytomegalovirus 1.

[83617] VGAM2466 precursor RNA folds onto itself, forming VGAM2466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83618] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2466 folded precursor RNA into VGAM2466 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2466 RNA is designated SEQ ID:5177, and is provided hereinbelow with reference to the sequence listing part.

[83619] VGAM2466 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2466 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2466 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83620] VGAM2466 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2466 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2466 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2466 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2466 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83621] The complementary binding of VGAM2466 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2466 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2466 host target RNA into VGAM2466 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83622] It is appreciated that VGAM2466 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2466 host target genes. The mRNA of each one of this plurality of VGAM2466 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2466 RNA, herein designated VGAM RNA, and which when bound by VGAM2466 RNA causes inhibition of translation of respective one or more VGAM2466 host target proteins.

[83623] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2466 gene, herein designated VGAM GENE, on one or more VGAM2466 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83624] It is yet further appreciated that a function of VGAM2466 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2466 correlate with, and may be deduced from, the identity of the host target genes which VGAM2466 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83625] Nucleotide sequences of the VGAM2466 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2466 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2466 are further described hereinbelow with reference to Table 1.

[83626] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2466 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2466 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[83627] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2466 gene, herein designated VGAM is inhibition of expression of VGAM2466 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2466 correlate with, and may be deduced from, the identity of the target genes which VGAM2466 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83628] Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_001174) is a VGAM2466 host target gene. ARHGAP6 BINDING SITE1 and ARHGAP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ARHGAP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE1 and ARHGAP6 BINDING SITE2, designated SEQ ID:6842 and SEQ ID:15084 respectively, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83629] A function of VGAM2466 is therefore inhibition of Rho GTPase Activating Protein 6 (ARHGAP6, Accession

NM_001174), a gene which activates the rho-type GTPases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Dimethylarginine Dimethylaminohydrolase 2 (DDAH2, Accession NM_013974) is another VGAM2466 host target gene. DDAH2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DDAH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDAH2 BINDING SITE, designated SEQ ID:15142, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83630] Another function of VGAM2466 is therefore inhibition of Dimethylarginine Dimethylaminohydrolase 2 (DDAH2, Accession NM_013974), a gene which regulates cellular methylarginine concentrations. Accordingly, utilities of

VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDAH2. The function of DDAH2 has been established by previous studies. Dimethylarginine dimethylaminohydrolase (DDAH; EC 3.5.3.18) regulates cellular methylarginine concentrations, which in turn inhibit nitric oxide synthase (see OMIM Ref. No. 163728) activity. Leiper et al. (1999) isolated a cDNA encoding DDAHI (OMIM Ref. No. 604743) and, by screening a database of translated open reading frames with the deduced DDAHI peptide sequence, identified DDAHII. Both DDAHI and DDAHII cDNAs encode 285-amino acid proteins. The DDAHII amino acid sequence shares 98% identity with that of its mouse homolog and 62% identity with the sequence of DDAHI. Northern blot analysis detected a 2.0-kb DDAHII transcript expressed at highest levels in heart, kidney, and placenta. Leiper et al. (1999) expressed a histidine-tagged DDAHII clone in E. coli and assayed the cell lysate for DDAH activity. Recombinant DDAHII metabolized ADMA and L-NMMA, but not SDMA or L-arginine, demonstrating that DDAHII is a functional homolog of DDAHI. By RNA dot blot analysis, Tran et al. (2000) determined that DDAH2 expression predominates in more highly vascularized tis-

sues and in immune tissues, while DDAH1 expression predominates in tissues that also express the neuronal isoform of NOS (OMIM Ref. No. 163731). Genomic sequence analysis indicated that DDAH2 contains 8 exons with 3 transcription start sites that generate alternatively spliced transcripts.

[83631] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

S.; Vallance, P. : Identification of two human dimethylarginine dimethylaminohydrolases with distinct tissue distributions and homology with microbial arginine deiminases. Biochem. J. 343: 209-214, 1999. ; and

[83633] Tran, C. T. L.; Fox, M. F.; Vallance, P.; Leiper, J. M. : Chromosomal localization, gene structure, and expression pattern of DDAH1: comparison with DDAH2 and implications for evolutio.

[83634] Further studies establishing the function and utilities of DDAH2 are found in John Hopkins OMIM database record ID 604744, and in sited publications numbered 6747-6748 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference.Diacylglycerol Kinase, Gamma 90kDa (DGKG, Accession NM_001346) is another VGAM2466 host target gene. DGKG BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DGKG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKG BINDING SITE, designated SEQ ID:7026, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83635] Another function of VGAM2466 is therefore inhibition of Diacylglycerol Kinase, Gamma 90kDa (DGKG, Accession NM_001346), a gene which may convert diacylglycerol to phosphatidic acid. Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKG. The function of DGKG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM451.Homeo Box B3 (HOXB3, Accession NM_002146) is another VGAM2466 host target gene. HOXB3 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by HOXB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXB3 BINDING SITE, designated SEQ ID:7921, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83636] Another function of VGAM2466 is therefore inhibition of Homeo Box B3 (HOXB3, Accession NM_002146). Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB3. Oxytocin Receptor (OXTR, Accession NM_000916) is another VGAM2466 host target gene. OXTR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by OXTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OXTR BINDING SITE, designated SEQ ID:6619, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83637] Another function of VGAM2466 is therefore inhibition of Oxytocin Receptor (OXTR, Accession NM_000916), a gene

which induces inward ion currents. Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXTR. The function of OXTR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM636.ENDO180 (Accession NM_006039) is another VGAM2466 host target gene. ENDO180 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENDO180, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENDO180 BINDING SITE, designated SEQ ID:12675, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83638] Another function of VGAM2466 is therefore inhibition of ENDO180 (Accession NM_006039). Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENDO180. FLJ14490 (Accession NM_032793) is another VGAM2466 host target gene. FLJ14490 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ14490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14490 BINDING SITE, designated SEQ ID:26545, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83639] Another function of VGAM2466 is therefore inhibition of FLJ14490 (Accession NM_032793). Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14490. FLJ20435 (Accession NM_017821) is another VGAM2466 host target gene. FLJ20435 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20435 BINDING SITE, designated SEQ ID:19467, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83640] Another function of VGAM2466 is therefore inhibition of FLJ20435 (Accession NM_017821). Accordingly, utilities of

VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20435. FLJ22202 (Accession NM_024883) is another VGAM2466 host target gene. FLJ22202 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22202 BINDING SITE, designated SEQ ID:24336, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83641] Another function of VGAM2466 is therefore inhibition of FLJ22202 (Accession NM_024883). Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22202. KIAA0555 (Accession XM_011347) is another VGAM2466 host target gene. KIAA0555 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0555, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0555 BINDING SITE, designated SEQ ID:30187, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83642] Another function of VGAM2466 is therefore inhibition of KIAA0555 (Accession XM_011347). Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0555. MGC4766 (Accession NM_031451) is another VGAM2466 host target gene. MGC4766 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC4766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4766 BINDING SITE, designated SEQ ID:25465, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83643] Another function of VGAM2466 is therefore inhibition of MGC4766 (Accession NM_031451). Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4766. Nucleoredoxin (NXN, Accession NM_022463) is another VGAM2466 host target gene. NXN BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXN BINDING SITE, designated SEQ ID:22805, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83644] Another function of VGAM2466 is therefore inhibition of Nucleoredoxin (NXN, Accession NM_022463). Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXN. LOC93349 (Accession NM_138402) is another VGAM2466 host target gene. LOC93349 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93349 BINDING SITE, designated SEQ ID:28768, to the nucleotide sequence of VGAM2466 RNA, herein designated VGAM RNA, also designated SEQ ID:5177.

[83645] Another function of VGAM2466 is therefore inhibition of

LOC93349 (Accession NM_138402). Accordingly, utilities of VGAM2466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93349. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2467 (VGAM2467) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83646] VGAM2467 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2467 was detected is described hereinabove with reference to Figs. 1-8.

[83647] VGAM2467 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2467 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83648] VGAM2467 gene encodes a VGAM2467 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2467 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2467 precursor RNA is designated SEQ ID:2453, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2453 is located at position 175100 relative to the genome of Mouse Cytomegalovirus 1.

[83649] VGAM2467 precursor RNA folds onto itself, forming VGAM2467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83650] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2467 folded precursor RNA into VGAM2467 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide se-

quence of VGAM2467 RNA is designated SEQ ID:5178, and is provided hereinbelow with reference to the sequence listing part.

[83651] VGAM2467 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2467 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2467 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83652] VGAM2467 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2467 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2467 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2467 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2467 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83653] The complementary binding of VGAM2467 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2467 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2467 host target RNA into VGAM2467 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83654] It is appreciated that VGAM2467 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2467 host target genes. The mRNA of each one of this plurality of VGAM2467 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2467 RNA, herein designated VGAM RNA, and which when bound by VGAM2467 RNA causes inhibition of translation of respective one or more VGAM2467 host target proteins.

[83655] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2467 gene, herein designated VGAM GENE, on one or more VGAM2467 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83656] It is yet further appreciated that a function of VGAM2467

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2467 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2467 correlate with, and may be deduced from, the identity of the host target genes which VGAM2467 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83657] Nucleotide sequences of the VGAM2467 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2467 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2467 are further described hereinbelow with reference to Table 1.

[83658] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2467 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2467 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83659] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2467 gene, herein designated VGAM is inhibition of expression of VGAM2467 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2467 correlate with, and may be deduced from, the identity of the target genes which VGAM2467 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83660] LOC154043 (Accession XM_087831) is a VGAM2467 host target gene. LOC154043 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154043 BINDING SITE, designated SEQ ID:39458, to the nucleotide sequence of VGAM2467 RNA, herein designated VGAM RNA, also designated SEQ ID:5178.

[83661] A function of VGAM2467 is therefore inhibition of LOC154043 (Accession XM_087831). Accordingly, utilities of VGAM2467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154043. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2468 (VGAM2468) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83662] VGAM2468 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2468 was detected is described hereinabove with reference to Figs. 1-8.

[83663] VGAM2468 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2468 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83664] VGAM2468 gene encodes a VGAM2468 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2468 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2468 precursor RNA is designated SEQ ID:2454, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2454 is located at position 64210 relative to the genome of Mouse Cytomegalovirus 1.

[83665] VGAM2468 precursor RNA folds onto itself, forming VGAM2468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83666] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2468 folded precursor RNA into VGAM2468 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2468 RNA is designated SEQ ID:5179, and is provided hereinbelow with reference to the sequence listing part.

[83667] VGAM2468 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2468 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2468 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83668] VGAM2468 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2468 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2468 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2468 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2468 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83669] The complementary binding of VGAM2468 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2468 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2468 host target RNA into VGAM2468 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83670] It is appreciated that VGAM2468 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2468 host target genes. The mRNA of each one of this plurality of VGAM2468 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2468 RNA, herein designated VGAM RNA, and which when bound by VGAM2468 RNA causes inhibition of translation of respective one or more

VGAM2468 host target proteins.

[83671] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2468 gene, herein designated VGAM GENE, on one or more VGAM2468 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83672] It is yet further appreciated that a function of VGAM2468 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1.

Specific functions, and accordingly utilities, of VGAM2468 correlate with, and may be deduced from, the identity of the host target genes which VGAM2468 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83673] Nucleotide sequences of the VGAM2468 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2468 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2468 are further described hereinbelow with reference to Table 1.

[83674] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2468 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2468 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83675] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2468 gene, herein designated VGAM is inhibition of expression of VGAM2468 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2468 correlate with, and may be deduced from, the identity of the target genes which VGAM2468 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83676] Glycyl-tRNA Synthetase (GARS, Accession NM_002047) is a VGAM2468 host target gene. GARS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GARS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GARS BINDING SITE, designated SEQ ID:7795, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83677] A function of VGAM2468 is therefore inhibition of Glycyl-tRNA Synthetase (GARS, Accession NM_002047), a gene which functions in protein biosynthesis. Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARS. The function of GARS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM113.MAP/microtubule Affinity-regu-

lating Kinase 3 (MARK3, Accession NM_002376) is another VGAM2468 host target gene. MARK3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MARK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MARK3 BINDING SITE, designated SEQ ID:8188, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83678] Another function of VGAM2468 is therefore inhibition of MAP/microtubule Affinity-regulating Kinase 3 (MARK3, Accession NM_002376), a gene which may be involved in cell cycle regulation. Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARK3. The function of MARK3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM964.Ret Finger Protein 2 (RFP2, Accession NM_052811) is another VGAM2468 host target gene. RFP2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RFP2, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFP2 BINDING SITE, designated SEQ ID:27399, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83679] Another function of VGAM2468 is therefore inhibition of Ret Finger Protein 2 (RFP2, Accession NM_052811), a gene which may act as a tumor suppressor. Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFP2. The function of RFP2 has been established by previous studies. B-cell chronic lymphocytic leukemia is often associated with the loss of a region on chromosome 13q14 between the retinoblastoma gene (RB1; 180200) and locus D13S25 (Liu et al., 1993; Liu et al., 1995), suggesting that a tumor suppressor gene may be located in this region. By constructing a cosmid contig corresponding to the minimally deleted region and screening a pre-B lymphocyte cDNA library, Kapanadze et al. (1998) isolated several clones, one of which contained an ORF encoding a deduced 407-amino acid protein, RFP2, which they called LEU5. RFP2 contains a zinc finger domain of the RING type

and shares significant homology with the RET finger protein (RFP; 602165) and the tumor suppressor gene BRCA1 (OMIM Ref. No. 113705). Kapanadze et al. (1998) mapped the RFP2 gene close to D13S272, bordering the minimally deleted region.

[83680] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83681] Kapanadze, B.; Kashuba, V.; Baranova, A.; Rasool, O.; van Everdink, W.; Liu, Y.; Syomova, A.; Corcoran, M.; Poltaraus, A.; Brodyansky, V.; Syomova, N.; Kazakov, A.; Ibbotson, R.; van den Berg, A.; Gizatullin, R.; Fedorova, L.; Sulimova, G.; Zelenin, A.; Deaven, L.; Lehrach, H.; Grander, D.; Buys, C.; Oscier, D.; Zabarovsky, E. R.; Einhorn, S.; Yankovsky, N. : A cosmid and cDNA fine physical map of a human chromosome 13q14 region frequently lost in B-cell chronic lymphocytic leukemia and identification of a new putative tumor suppressor gene, Leu5. FEBS Lett. 426: 266-270, 1998. ; and

[83682] Liu, Y.; Hermanson, M.; Grander, D.; Merup, M.; Wu, X.; Heyman, M.; Rasool, O.; Juliusson, G.; Gahrton, G.; Detlofsson, R. : 13q deletions in lymphoid malignancies. Blood 86: 1911-1915.

[83683] Further studies establishing the function and utilities of RFP2 are found in John Hopkins OMIM database record ID 605661, and in sited publications numbered 6409-6411 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.DKFZP434H204 (Accession XM_039153) is another VGAM2468 host target gene. DKFZP434H204 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434H204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H204 BINDING SITE, designated SEQ ID:33016, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83684] Another function of VGAM2468 is therefore inhibition of DKFZP434H204 (Accession XM_039153). Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H204. F-box Only Protein 26 (FBXO26, Accession NM_024907) is another VGAM2468 host target gene. FBXO26 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

FBXO26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO26 BINDING SITE, designated SEQ ID:24405, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83685] Another function of VGAM2468 is therefore inhibition of F-box Only Protein 26 (FBXO26, Accession NM_024907). Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO26. FLJ12089 (Accession NM_024552) is another VGAM2468 host target gene. FLJ12089 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12089 BINDING SITE, designated SEQ ID:23771, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83686] Another function of VGAM2468 is therefore inhibition of

FLJ12089 (Accession NM_024552). Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12089. FLJ32919 (Accession NM_144588) is another VGAM2468 host target gene. FLJ32919 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ32919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32919 BINDING SITE, designated SEQ ID:29408, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83687] Another function of VGAM2468 is therefore inhibition of FLJ32919 (Accession NM_144588). Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32919. KIAA0963 (Accession NM_014963) is another VGAM2468 host target gene. KIAA0963 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0963 BINDING SITE, designated SEQ ID:17343, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83688] Another function of VGAM2468 is therefore inhibition of KIAA0963 (Accession NM_014963). Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0963. UDP-N-acteylglucosamine Pyrophosphorylase 1 (UAP1, Accession NM_003115) is another VGAM2468 host target gene. UAP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by UAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UAP1 BINDING SITE, designated SEQ ID:9087, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83689] Another function of VGAM2468 is therefore inhibition of UDP-N-acteylglucosamine Pyrophosphorylase 1 (UAP1, Accession NM_003115). Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with UAP1. XPO5 (Accession XM_166042) is another VGAM2468 host target gene. XPO5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by XPO5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPO5 BINDING SITE, designated SEQ ID:43840, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83690] Another function of VGAM2468 is therefore inhibition of XPO5 (Accession XM_166042). Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPO5. LOC128402 (Accession XM_066002) is another VGAM2468 host target gene. LOC128402 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC128402, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128402 BINDING SITE, designated SEQ ID:37317, to

the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83691] Another function of VGAM2468 is therefore inhibition of LOC128402 (Accession XM_066002). Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128402. LOC146243 (Accession XM_096956) is another VGAM2468 host target gene. LOC146243 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146243 BINDING SITE, designated SEQ ID:40676, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83692] Another function of VGAM2468 is therefore inhibition of LOC146243 (Accession XM_096956). Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146243. LOC153811 (Accession XM_087779) is another VGAM2468 host target gene. LOC153811 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC153811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153811 BINDING SITE, designated SEQ ID:39414, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83693] Another function of VGAM2468 is therefore inhibition of LOC153811 (Accession XM_087779). Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153811. LOC157226 (Accession XM_033876) is another VGAM2468 host target gene. LOC157226 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157226 BINDING SITE, designated SEQ ID:31975, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83694] Another function of VGAM2468 is therefore inhibition of LOC157226 (Accession XM_033876). Accordingly, utilities

of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157226. LOC222166 (Accession XM_168425) is another VGAM2468 host target gene. LOC222166 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222166 BINDING SITE, designated SEQ ID:45153, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83695] Another function of VGAM2468 is therefore inhibition of LOC222166 (Accession XM_168425). Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222166. LOC93017 (Accession XM_048772) is another VGAM2468 host target gene. LOC93017 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC93017 BINDING SITE, designated SEQ ID:35254, to the nucleotide sequence of VGAM2468 RNA, herein designated VGAM RNA, also designated SEQ ID:5179.

[83696] Another function of VGAM2468 is therefore inhibition of LOC93017 (Accession XM_048772). Accordingly, utilities of VGAM2468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93017. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2469 (VGAM2469) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83697] VGAM2469 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2469 was detected is described hereinabove with reference to Figs. 1-8.

[83698] VGAM2469 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2469 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83699] VGAM2469 gene encodes a VGAM2469 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2469 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2469 precursor RNA is designated SEQ ID:2455, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2455 is located at position 226054 relative to the genome of Mouse Cytomegalovirus 1.

[83700] VGAM2469 precursor RNA folds onto itself, forming VGAM2469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83701] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2469 folded precursor RNA into VGAM2469 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2469 RNA is designated SEQ ID:5180, and is provided hereinbelow with reference to the sequence listing part.

[83702] VGAM2469 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2469 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2469 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83703] VGAM2469 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2469 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2469 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2469 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2469 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83704] The complementary binding of VGAM2469 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2469 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2469 host target RNA into VGAM2469 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83705] It is appreciated that VGAM2469 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2469 host target genes. The mRNA of each one of this plurality of VGAM2469 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2469 RNA, herein designated VGAM RNA, and which when bound by VGAM2469 RNA causes inhibition of translation of respective one or more VGAM2469 host target proteins.

[83706] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2469 gene, herein designated VGAM GENE, on one or more VGAM2469 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83707] It is yet further appreciated that a function of VGAM2469 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2469 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2469 correlate with, and may be deduced from, the identity of the host target genes which VGAM2469 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83708] Nucleotide sequences of the VGAM2469 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2469 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2469 are further described hereinbelow with reference to Table 1.

[83709] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2469 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2469 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83710] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2469 gene, herein designated VGAM is inhibition of expression of VGAM2469 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2469 correlate with, and may be deduced from, the identity of the target genes which VGAM2469 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83711] Diaphorase (NADH) (cytochrome b-5 reductase) (DIA1, Accession NM_007326) is a VGAM2469 host target gene. DIA1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DIA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIA1 BINDING SITE, designated SEQ ID:14245, to the nucleotide sequence of VGAM2469 RNA, herein designated VGAM RNA, also designated SEQ ID:5180.

[83712] A function of VGAM2469 is therefore inhibition of Di-

aphorase (NADH) (cytochrome b-5 reductase) (DIA1, Accession NM_007326). Accordingly, utilities of VGAM2469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIA1. Deleted In Lung and Esophageal Cancer 1 (DLEC1, Accession NM_007338) is another VGAM2469 host target gene. DLEC1 BINDING SITE1 and DLEC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DLEC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLEC1 BINDING SITE1 and DLEC1 BINDING SITE2, designated SEQ ID:14268 and SEQ ID:14262 respectively, to the nucleotide sequence of VGAM2469 RNA, herein designated VGAM RNA, also designated SEQ ID:5180.

[83713] Another function of VGAM2469 is therefore inhibition of Deleted In Lung and Esophageal Cancer 1 (DLEC1, Accession NM_007338). Accordingly, utilities of VGAM2469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLEC1. Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM_002531) is another VGAM2469 host target gene. NTSR1 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NTSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTSR1 BINDING SITE, designated SEQ ID:8365, to the nucleotide sequence of VGAM2469 RNA, herein designated VGAM RNA, also designated SEQ ID:5180.

[83714] Another function of VGAM2469 is therefore inhibition of Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM_002531), a gene which is associated with g proteins that activate a phosphatidylinositol- calcium second messenger system. Accordingly, utilities of VGAM2469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTSR1. The function of NTSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077) is another VGAM2469 host target gene. GOLGA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GOLGA1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE, designated SEQ ID:7858, to the nucleotide sequence of VGAM2469 RNA, herein designated VGAM RNA, also designated SEQ ID:5180.

[83715] Another function of VGAM2469 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077). Accordingly, utilities of VGAM2469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1. LOC149566 (Accession XM_097670) is another VGAM2469 host target gene. LOC149566 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149566 BINDING SITE, designated SEQ ID:41014, to the nucleotide sequence of VGAM2469 RNA, herein designated VGAM RNA, also designated SEQ ID:5180.

[83716] Another function of VGAM2469 is therefore inhibition of LOC149566 (Accession XM_097670). Accordingly, utilities

of VGAM2469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149566. LOC150967 (Accession XM_087060) is another VGAM2469 host target gene. LOC150967 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150967, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150967 BINDING SITE, designated SEQ ID:39033, to the nucleotide sequence of VGAM2469 RNA, herein designated VGAM RNA, also designated SEQ ID:5180.

[83717] Another function of VGAM2469 is therefore inhibition of LOC150967 (Accession XM_087060). Accordingly, utilities of VGAM2469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150967. LOC151124 (Accession XM_098006) is another VGAM2469 host target gene. LOC151124 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151124, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC151124 BINDING SITE, designated SEQ ID:41300, to the nucleotide sequence of VGAM2469 RNA, herein designated VGAM RNA, also designated SEQ ID:5180.

[83718] Another function of VGAM2469 is therefore inhibition of LOC151124 (Accession XM_098006). Accordingly, utilities of VGAM2469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151124. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2470 (VGAM2470) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83719] VGAM2470 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2470 was detected is described hereinabove with reference to Figs. 1-8.

[83720] VGAM2470 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2470 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83721] VGAM2470 gene encodes a VGAM2470 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2470 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2470 precursor RNA is designated SEQ ID:2456, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2456 is located at position 195573 relative to the genome of Mouse Cytomegalovirus 1.

[83722] VGAM2470 precursor RNA folds onto itself, forming VGAM2470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83723] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2470 folded precursor RNA into VGAM2470 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2470 RNA is designated SEQ ID:5181, and is provided hereinbelow with reference to the sequence listing part.

[83724] VGAM2470 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2470 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2470 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83725] VGAM2470 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2470 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2470 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2470 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2470 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83726] The complementary binding of VGAM2470 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2470 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2470 host target RNA into VGAM2470 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83727] It is appreciated that VGAM2470 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2470 host target genes. The mRNA of each one of this plurality of VGAM2470 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2470 RNA, herein designated VGAM RNA, and which when bound by VGAM2470 RNA causes inhibition of translation of respective one or more VGAM2470 host target proteins.

[83728] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2470 gene, herein designated VGAM GENE, on one or more VGAM2470 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83729] It is yet further appreciated that a function of VGAM2470 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2470 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2470 correlate with, and may be deduced from, the identity of the host target genes which VGAM2470 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83730] Nucleotide sequences of the VGAM2470 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2470 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2470 are further described hereinbelow with reference to Table 1.

[83731] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2470 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2470 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83732] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2470 gene, herein designated VGAM is inhibition of expression of VGAM2470 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2470 correlate with, and may be deduced from, the identity of the target genes which VGAM2470 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83733] Epithelial Membrane Protein 1 (EMP1, Accession NM_001423) is a VGAM2470 host target gene. EMP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMP1 BINDING SITE, designated SEQ ID:7130, to the nucleotide sequence of VGAM2470 RNA, herein designated VGAM RNA, also designated SEQ ID:5181.

[83734] A function of VGAM2470 is therefore inhibition of Epithe-

lial Membrane Protein 1 (EMP1, Accession NM_001423), a gene which plays a role in squamous cell differentiation; member of the PMP22/EMP/MP20 family of membrane glycoproteins. Accordingly, utilities of VGAM2470 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMP1. The function of EMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2471 (VGAM2471) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83735] VGAM2471 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2471 was detected is described hereinabove with reference to Figs. 1-8.

[83736] VGAM2471 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2471 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[83737] VGAM2471 gene encodes a VGAM2471 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2471 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2471 precursor RNA is designated SEQ ID:2457, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2457 is located at position 2006 relative to the genome of Mouse Cytomegalovirus 1.

[83738] VGAM2471 precursor RNA folds onto itself, forming VGAM2471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83739] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2471 folded precursor RNA into VGAM2471 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2471 RNA is designated SEQ ID:5182, and is provided hereinbelow with reference to the sequence listing part.

[83740] VGAM2471 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2471 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2471 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83741] VGAM2471 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2471 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2471 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2471 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2471 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83742] The complementary binding of VGAM2471 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2471 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2471 host target RNA into VGAM2471 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83743] It is appreciated that VGAM2471 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2471 host target genes. The mRNA of each one of this plurality of VGAM2471 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2471 RNA, herein designated VGAM RNA, and which when bound by VGAM2471 RNA causes inhibition of translation of respective one or more VGAM2471 host target proteins.

[83744] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2471 gene, herein designated VGAM GENE, on one or more VGAM2471 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83745] It is yet further appreciated that a function of VGAM2471 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2471 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2471 correlate with, and may be deduced from, the identity of the host target genes which VGAM2471 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83746] Nucleotide sequences of the VGAM2471 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2471 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2471 are further described hereinbelow with reference to Table 1.

[83747] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2471 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2471 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83748] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2471 gene, herein designated VGAM is inhibition of expression of VGAM2471 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2471 correlate with, and may be deduced from, the identity of the target genes which VGAM2471 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83749] Neuro-oncological Ventral Antigen 1 (NOVA1, Accession NM_002515) is a VGAM2471 host target gene. NOVA1 BINDING SITE1 and NOVA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NOVA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOVA1 BINDING SITE1 and NOVA1 BINDING SITE2, designated SEQ ID:8349 and SEQ ID:13218 respectively, to the nucleotide sequence of

VGAM2471 RNA, herein designated VGAM RNA, also designated SEQ ID:5182.

[83750] A function of VGAM2471 is therefore inhibition of Neuro-oncological Ventral Antigen 1 (NOVA1, Accession NM_002515), a gene which may regulate rna splicing or metabolism in a specific subset of developing neurons. Accordingly, utilities of VGAM2471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOVA1. The function of NOVA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM521.KIAA0446 (Accession XM_044155) is another VGAM2471 host target gene. KIAA0446 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:34144, to the nucleotide sequence of VGAM2471 RNA, herein designated VGAM RNA, also designated SEQ ID:5182.

[83751] Another function of VGAM2471 is therefore inhibition of

KIAA0446 (Accession XM_044155). Accordingly, utilities of VGAM2471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2472 (VGAM2472) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83752] VGAM2472 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2472 was detected is described hereinabove with reference to Figs. 1-8.

[83753] VGAM2472 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2472 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83754] VGAM2472 gene encodes a VGAM2472 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2472 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2472 precursor RNA is designated SEQ ID:2458, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2458 is located at position 116628 relative to the genome of Mouse Cytomegalovirus 1.

[83755] VGAM2472 precursor RNA folds onto itself, forming VGAM2472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83756] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2472 folded precursor RNA into VGAM2472 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM2472 RNA is designated SEQ ID:5183, and is provided hereinbelow with reference to the sequence listing part.

[83757] VGAM2472 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2472 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2472 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83758] VGAM2472 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2472 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2472 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2472 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2472 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83759] The complementary binding of VGAM2472 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2472 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2472 host target RNA into VGAM2472 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83760] It is appreciated that VGAM2472 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2472 host target genes. The mRNA of each one of this plurality of VGAM2472 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2472 RNA, herein designated VGAM RNA, and which when bound by VGAM2472 RNA causes inhibition of translation of respective one or more VGAM2472 host target proteins.

[83761] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2472 gene, herein designated VGAM GENE, on one or more VGAM2472 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83762] It is yet further appreciated that a function of VGAM2472

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2472 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2472 correlate with, and may be deduced from, the identity of the host target genes which VGAM2472 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83763] Nucleotide sequences of the VGAM2472 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2472 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2472 are further described hereinbelow with reference to Table 1.

[83764] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2472 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2472 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83765] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2472 gene, herein designated VGAM is inhibition of expression of VGAM2472 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2472 correlate with, and may be deduced from, the identity of the target genes which VGAM2472 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83766] Integrin, Alpha 11 (ITGA11, Accession NM_012211) is a VGAM2472 host target gene. ITGA11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA11 BINDING SITE, designated SEQ ID:14515, to the nucleotide sequence of VGAM2472 RNA, herein designated VGAM RNA, also designated SEQ ID:5183.

[83767] A function of VGAM2472 is therefore inhibition of Integrin, Alpha 11 (ITGA11, Accession NM_012211), a gene which acts as a collagen I receptor. Accordingly, utilities of VGAM2472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

ITGA11. The function of ITGA11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Surfactant, Pulmonary-associated Protein A2 (SFTPA2, Accession NM_006926) is another VGAM2472 host target gene. SFTPA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFTPA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFTPA2 BINDING SITE, designated SEQ ID:13809, to the nucleotide sequence of VGAM2472 RNA, herein designated VGAM RNA, also designated SEQ ID:5183.

[83768] Another function of VGAM2472 is therefore inhibition of Surfactant, Pulmonary-associated Protein A2 (SFTPA2, Accession NM_006926), a gene which plays a role in innate host defense in the lung. Accordingly, utilities of VGAM2472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFTPA2. The function of SFTPA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM148.Serine/arginine Repetitive Matrix 1 (SRRM1, Accession NM_005839) is another VGAM2472 host target gene. SRRM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SRRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRRM1 BINDING SITE, designated SEQ ID:12450, to the nucleotide sequence of VGAM2472 RNA, herein designated VGAM RNA, also designated SEQ ID:5183.

[83769] Another function of VGAM2472 is therefore inhibition of Serine/arginine Repetitive Matrix 1 (SRRM1, Accession NM_005839). Accordingly, utilities of VGAM2472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRRM1. GREB1 (Accession XM_051545) is another VGAM2472 host target gene. GREB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GREB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GREB1 BINDING SITE, designated SEQ

ID:35853, to the nucleotide sequence of VGAM2472 RNA, herein designated VGAM RNA, also designated SEQ ID:5183.

[83770] Another function of VGAM2472 is therefore inhibition of GREB1 (Accession XM_051545). Accordingly, utilities of VGAM2472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GREB1. KIAA0537 (Accession NM_014840) is another VGAM2472 host target gene. KIAA0537 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0537 BINDING SITE, designated SEQ ID:16868, to the nucleotide sequence of VGAM2472 RNA, herein designated VGAM RNA, also designated SEQ ID:5183.

[83771] Another function of VGAM2472 is therefore inhibition of KIAA0537 (Accession NM_014840). Accordingly, utilities of VGAM2472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0537. MGC4504 (Accession NM_024111) is another VGAM2472 host target gene. MGC4504 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4504 BINDING SITE, designated SEQ ID:23558, to the nucleotide sequence of VGAM2472 RNA, herein designated VGAM RNA, also designated SEQ ID:5183.

[83772] Another function of VGAM2472 is therefore inhibition of MGC4504 (Accession NM_024111). Accordingly, utilities of VGAM2472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4504. Purinergic Receptor P2X, Ligand-gated Ion Channel, 5 (P2RX5, Accession NM_002561) is another VGAM2472 host target gene. P2RX5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P2RX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RX5 BINDING SITE, designated SEQ ID:8410, to the nucleotide sequence of VGAM2472 RNA, herein designated VGAM RNA, also designated SEQ ID:5183.

[83773] Another function of VGAM2472 is therefore inhibition of Purinergic Receptor P2X, Ligand-gated Ion Channel, 5 (P2RX5, Accession NM_002561). Accordingly, utilities of VGAM2472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX5. LOC148918 (Accession XM_086361) is another VGAM2472 host target gene. LOC148918 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148918 BINDING SITE, designated SEQ ID:38615, to the nucleotide sequence of VGAM2472 RNA, herein designated VGAM RNA, also designated SEQ ID:5183.

[83774] Another function of VGAM2472 is therefore inhibition of LOC148918 (Accession XM_086361). Accordingly, utilities of VGAM2472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148918. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2473 (VGAM2473) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83775] VGAM2473 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2473 was detected is described hereinabove with reference to Figs. 1-8.

[83776] VGAM2473 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2473 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83777] VGAM2473 gene encodes a VGAM2473 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2473 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2473 precursor RNA is designated SEQ ID:2459, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2459 is located at position 101492 relative to the genome of Mouse Cytomegalovirus 1.

[83778] VGAM2473 precursor RNA folds onto itself, forming

VGAM2473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83779] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2473 folded precursor RNA into VGAM2473 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2473 RNA is designated SEQ ID:5184, and is provided hereinbelow with reference to the sequence listing part.

[83780] VGAM2473 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2473 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2473 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83781] VGAM2473 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2473 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2473 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2473 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2473 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83782] The complementary binding of VGAM2473 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2473 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2473 host target RNA into VGAM2473 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83783] It is appreciated that VGAM2473 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2473 host target genes. The mRNA of each one of this plurality of VGAM2473 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2473 RNA, herein designated VGAM RNA, and which when bound by VGAM2473 RNA causes inhibition of translation of respective one or more VGAM2473 host target proteins.

[83784] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2473 gene, herein designated VGAM GENE, on one or more VGAM2473 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83785] It is yet further appreciated that a function of VGAM2473 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2473 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2473 correlate with, and may be deduced from, the identity of the host target genes which VGAM2473 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[83786] Nucleotide sequences of the VGAM2473 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2473 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2473 are further described hereinbelow with reference to Table 1.

[83787] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2473 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2473 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83788] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2473 gene, herein designated VGAM is inhibition of expression of VGAM2473 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2473 correlate with, and may be deduced from, the identity of the target genes which VGAM2473 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[83789] Cyclin-dependent Kinase Inhibitor 1C (p57, Kip2) (CDKN1C, Accession NM_000076) is a VGAM2473 host target gene. CDKN1C BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDKN1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN1C BINDING SITE, designated SEQ ID:5521, to the nucleotide sequence of VGAM2473 RNA, herein designated VGAM RNA, also designated SEQ ID:5184.

[83790] A function of VGAM2473 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 1C (p57, Kip2) (CDKN1C, Accession NM_000076). Accordingly, utilities of VGAM2473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN1C. Dystrobrevin, Alpha (DTNA, Accession NM_001391) is another VGAM2473 host target gene. DTNA BINDING SITE1 through DTNA BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DTNA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of DTNA BINDING SITE1 through DTNA BINDING SITE4, designated SEQ ID:7083, SEQ ID:26840, SEQ ID:26845 and SEQ ID:26850 respectively, to the nucleotide sequence of VGAM2473 RNA, herein designated VGAM RNA, also designated SEQ ID:5184.

[83791] Another function of VGAM2473 is therefore inhibition of Dystrobrevin, Alpha (DTNA, Accession NM_001391), a gene which may be involved in the formation and stability of synapses. Accordingly, utilities of VGAM2473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTNA. The function of DTNA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1021.Nucleolar Protein 4 (NOL4, Accession NM_003787) is another VGAM2473 host target gene. NOL4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NOL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOL4 BINDING SITE, designated SEQ ID:9875,

to the nucleotide sequence of VGAM2473 RNA, herein designated VGAM RNA, also designated SEQ ID:5184.

[83792] Another function of VGAM2473 is therefore inhibition of Nucleolar Protein 4 (NOL4, Accession NM_003787). Accordingly, utilities of VGAM2473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOL4. SC65 (Accession NM_006455) is another VGAM2473 host target gene. SC65 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SC65, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SC65 BINDING SITE, designated SEQ ID:13173, to the nucleotide sequence of VGAM2473 RNA, herein designated VGAM RNA, also designated SEQ ID:5184.

[83793] Another function of VGAM2473 is therefore inhibition of SC65 (Accession NM_006455). Accordingly, utilities of VGAM2473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SC65. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger

2474 (VGAM2474) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83794] VGAM2474 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2474 was detected is described hereinabove with reference to Figs. 1-8.

[83795] VGAM2474 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2474 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83796] VGAM2474 gene encodes a VGAM2474 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2474 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2474 precursor RNA is designated SEQ ID:2460, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2460 is located at position 82294 relative to the genome of Mouse Cytomegalovirus 1.

[83797] VGAM2474 precursor RNA folds onto itself, forming

VGAM2474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83798] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2474 folded precursor RNA into VGAM2474 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2474 RNA is designated SEQ ID:5185, and is provided hereinbelow with reference to the sequence listing part.

[83799] VGAM2474 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2474 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2474 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83800] VGAM2474 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2474 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2474 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2474 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2474 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83801] The complementary binding of VGAM2474 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2474 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2474 host target RNA into VGAM2474 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83802] It is appreciated that VGAM2474 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2474 host target genes. The mRNA of each one of this plurality of VGAM2474 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2474 RNA, herein designated VGAM RNA, and which when bound by VGAM2474 RNA causes inhibition of translation of respective one or more VGAM2474 host target proteins.

[83803] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2474 gene, herein designated VGAM GENE, on one or more VGAM2474 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83804] It is yet further appreciated that a function of VGAM2474 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2474 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2474 correlate with, and may be deduced from, the identity of the host target genes which VGAM2474 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[83805] Nucleotide sequences of the VGAM2474 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2474 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2474 are further described hereinbelow with reference to Table 1.

[83806] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2474 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2474 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83807] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2474 gene, herein designated VGAM is inhibition of expression of VGAM2474 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2474 correlate with, and may be deduced from, the identity of the target genes which VGAM2474 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[83808] KIAA0475 (Accession NM_014864) is a VGAM2474 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16945, to the nucleotide sequence of VGAM2474 RNA, herein designated VGAM RNA, also designated SEQ ID:5185.

[83809] A function of VGAM2474 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM2474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC257482 (Accession XM_168544) is another VGAM2474 host target gene. LOC257482 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257482 BINDING SITE, designated SEQ ID:45234, to

the nucleotide sequence of VGAM2474 RNA, herein designated VGAM RNA, also designated SEQ ID:5185.

[83810] Another function of VGAM2474 is therefore inhibition of LOC257482 (Accession XM_168544). Accordingly, utilities of VGAM2474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257482. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2475 (VGAM2475) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83811] VGAM2475 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2475 was detected is described hereinabove with reference to Figs. 1-8.

[83812] VGAM2475 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2475 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83813] VGAM2475 gene encodes a VGAM2475 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2475 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2475 precursor RNA is designated SEQ ID:2461, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2461 is located at position 190173 relative to the genome of Mouse Cytomegalovirus 1.

[83814] VGAM2475 precursor RNA folds onto itself, forming VGAM2475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83815] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2475 folded precursor RNA into VGAM2475 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2475 RNA is designated SEQ ID:5186, and is provided hereinbelow with reference to the sequence listing part.

[83816] VGAM2475 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2475 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2475 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83817] VGAM2475 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2475 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2475 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2475 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2475 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83818] The complementary binding of VGAM2475 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2475 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2475 host target RNA into VGAM2475 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83819] It is appreciated that VGAM2475 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2475 host target genes. The mRNA of each one of this plurality of VGAM2475 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2475 RNA, herein designated VGAM RNA, and which when bound by VGAM2475 RNA causes inhibition of translation of respective one or more VGAM2475 host target proteins.

[83820] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2475 gene, herein designated VGAM GENE, on one or more VGAM2475 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83821] It is yet further appreciated that a function of VGAM2475 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2475 correlate with, and may be deduced from, the identity of the host target genes which VGAM2475 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83822] Nucleotide sequences of the VGAM2475 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2475 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2475 are further described hereinbelow with reference to Table 1.

[83823] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2475 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2475 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83824] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2475 gene, herein designated VGAM is inhibition of expression of VGAM2475 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2475 correlate with, and may be deduced from, the identity of the target genes which VGAM2475 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83825] Adenylate Kinase 1 (AK1, Accession NM_000476) is a VGAM2475 host target gene. AK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK1 BINDING SITE, designated SEQ ID:6084, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83826] A function of VGAM2475 is therefore inhibition of Adenylate Kinase 1 (AK1, Accession NM_000476). Accordingly,

utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK1. Cyclin-dependent Kinase 5, Regulatory Subunit 2 (p39) (CDK5R2, Accession NM_003936) is another VGAM2475 host target gene. CDK5R2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDK5R2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK5R2 BINDING SITE, designated SEQ ID:10040, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83827] Another function of VGAM2475 is therefore inhibition of Cyclin-dependent Kinase 5, Regulatory Subunit 2 (p39) (CDK5R2, Accession NM_003936), a gene which acts as a regulatory subunit for the cyclin-dependent CDK5. Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK5R2. The function of CDK5R2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM403.Early Growth Re-

sponse 2 (Krox-20 homolog, Drosophila) (EGR2, Accession NM_000399) is another VGAM2475 host target gene. EGR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EGR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR2 BINDING SITE, designated SEQ ID:5969, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83828] Another function of VGAM2475 is therefore inhibition of Early Growth Response 2 (Krox-20 homolog, Drosophila) (EGR2, Accession NM_000399), a gene which binds to two specific dna sites located in the promoter region of hox-1.4. Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR2. The function of EGR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM234.Fragile X Mental Retardation, Autosomal Homolog 2 (FXR2, Accession NM_004860) is another VGAM2475 host target gene. FXR2 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by FXR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXR2 BINDING SITE, designated SEQ ID:11269, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83829] Another function of VGAM2475 is therefore inhibition of Fragile X Mental Retardation, Autosomal Homolog 2 (FXR2, Accession NM_004860), a gene which is a rna-binding protein. interacts with fmr1 and fxr1. Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXR2. The function of FXR2 has been established by previous studies. Fragile X mental retardation is directly associated with the FMR1 gene at Xq27.3 (OMIM Ref. No. 309550). FMR1 is an RNA-binding protein, and mutations in the gene are believed to result in the absence or reduced expression of the protein or a functionally impaired mutant protein. FMR1 protein and the fragile X-related proteins 1 and 2 (FXR1; 600819 and FXR2) form a family with functional similarities, such as RNA binding, polyribosomal association, and nucleocytoplasmic shuttling.

Animal model experiments lend further support to the function of FXR2. Bontekoe et al. (2002) generated an Fxr2 knockout mouse model. No pathologic differences between knockout and wildtype mice were found in brain or testis; however, their behaviors were distinctive. Fxr2 knockout mice were hyperactive (i.e., traveled a greater distance, spent more time moving, and moved faster) in the open-field test, were impaired on the rotarod test, had reduced levels of prepulse inhibition, displayed less contextual conditioned fear, were impaired at locating the hidden platform in the Morris water task, and were less sensitive to a heat stimulus. The authors implicated a role for Fxr2 in central nervous system function.

[83830] It is appreciated that the abovementioned animal model for FXR2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[83831] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83832] Bontekoe, C. J. M.; McIlwain, K. L.; Nieuwenhuizen, I. M.; Yuva-Paylor, L. A.; Nellis, A.; Willemsen, R.; Fang, Z.; Kirkpatrick, L.; Bakker, C. E.; McAninch, R.; Cheng, N. C.; Mer-

riweather, M.; Hoogeveen, A. T.; Nelson, D.; Paylor, R.; Oostra, B. A. : Knockout mouse model for Fxr2: a model for mental retardation. Hum. Molec. Genet. 11: 487-498, 2002. ; and

[83833] Tamanini, F.; Bontekoe, C.; Bakker, C. E.; van Unen, L.; Anar, B.; Willemsen, R.; Yoshida, M.; Galjaard, H.; Oostra, B. A.; Hoogeveen, A. T. : Different targets for the fragile X-relate.

[83834] Further studies establishing the function and utilities of FXR2 are found in John Hopkins OMIM database record ID 605339, and in sited publications numbered 2308, 7527-752 and 2309-2310 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Integrin, Alpha 3 (antigen CD49C, alpha 3 subunit of VLA-3 receptor) (ITGA3, Accession NM_002204) is another VGAM2475 host target gene. ITGA3 BINDING SITE1 and ITGA3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ITGA3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA3 BINDING SITE1 and ITGA3 BINDING SITE2, designated SEQ ID:7967 and SEQ ID:12010 respec-

tively, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83835] Another function of VGAM2475 is therefore inhibition of Integrin, Alpha 3 (antigen CD49C, alpha 3 subunit of VLA-3 receptor) (ITGA3, Accession NM_002204), a gene which is a receptor for fibronectin, laminin, collagen, epiligrin and thrombospondin. Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA3. The function of ITGA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1020.Nyctalopin (NYX, Accession NM_022567) is another VGAM2475 host target gene. NYX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NYX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYX BINDING SITE, designated SEQ ID:22886, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83836] Another function of VGAM2475 is therefore inhibition of Nyctalopin (NYX, Accession NM_022567), a gene which functions as the von willebrand factor receptor and mediates von willebrand factor-dependent platelet adhesion to blood vessels. the adhesion of platelets to injured vascular surfaces in the arterial circulation is a critical initiating event in hemostasis (by similarity). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYX. The function of NYX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM_166424) is another VGAM2475 host target gene. PACSIN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PACSIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACSIN1 BINDING SITE, designated SEQ ID:44311, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83837] Another function of VGAM2475 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM_166424). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACSIN1. p21(CDKN1A)-activated Kinase 4 (PAK4, Accession NM_005884) is another VGAM2475 host target gene. PAK4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK4 BINDING SITE, designated SEQ ID:12506, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83838] Another function of VGAM2475 is therefore inhibition of p21(CDKN1A)-activated Kinase 4 (PAK4, Accession NM_005884). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK4. Protein Phosphatase 2, Regulatory Subunit B (B56), Alpha Isoform (PPP2R5A, Accession NM_006243) is another VGAM2475 host target gene. PPP2R5A BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by PPP2R5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5A BINDING SITE, designated SEQ ID:12911, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83839] Another function of VGAM2475 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Alpha Isoform (PPP2R5A, Accession NM_006243), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5A. The function of PPP2R5A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675.Protein Kinase, CAMP-dependent, Catalytic, Alpha (PRKACA, Accession NM_002730) is another VGAM2475 host target gene. PRKACA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKACA, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKACA BINDING SITE, designated SEQ ID:8596, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83840] Another function of VGAM2475 is therefore inhibition of Protein Kinase, CAMP-dependent, Catalytic, Alpha (PRKACA, Accession NM_002730), a gene which phosphorylates target proteins on serine or threonine residues. Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKACA. The function of PRKACA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175.Runt-related Transcription Factor 3 (RUNX3, Accession NM_004350) is another VGAM2475 host target gene. RUNX3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RUNX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of RUNX3 BINDING SITE, designated SEQ ID:10547, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83841] Another function of VGAM2475 is therefore inhibition of Runt-related Transcription Factor 3 (RUNX3, Accession NM_004350), a gene which binds to the core site, 5'-pygpyggt-3', of a number of enhancers and promoters. Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX3. The function of RUNX3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151.Secreted and Transmembrane 1 (SECTM1, Accession NM_003004) is another VGAM2475 host target gene. SECTM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SECTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SECTM1 BINDING SITE, designated SEQ ID:8909, to the nucleotide sequence of VGAM2475 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5186.

[83842] Another function of VGAM2475 is therefore inhibition of Secreted and Transmembrane 1 (SECTM1, Accession NM_003004). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SECTM1. SH3-domain GRB2-like 1 (SH3GL1, Accession NM_003025) is another VGAM2475 host target gene. SH3GL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3GL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3GL1 BINDING SITE, designated SEQ ID:8963, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83843] Another function of VGAM2475 is therefore inhibition of SH3-domain GRB2-like 1 (SH3GL1, Accession NM_003025). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3GL1. SORCS1 (Accession NM_052918) is another VGAM2475 host target gene. SORCS1 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by SORCS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS1 BINDING SITE, designated SEQ ID:27482, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83844] Another function of VGAM2475 is therefore inhibition of SORCS1 (Accession NM_052918). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS1. SRY (sex determining region Y)-box 4 (SOX4, Accession NM_003107) is another VGAM2475 host target gene. SOX4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX4 BINDING SITE, designated SEQ ID:9071, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83845] Another function of VGAM2475 is therefore inhibition of

SRY (sex determining region Y)-box 4 (SOX4, Accession NM_003107), a gene which binds with high affinity to the t-cell enhancer motif 5'-aacaaag-3' motif. Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX4. The function of SOX4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM409.T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM_003189) is another VGAM2475 host target gene. TAL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAL1 BINDING SITE, designated SEQ ID:9168, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83846] Another function of VGAM2475 is therefore inhibition of T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM_003189), a gene which may help control cell growth and differentiation. Accordingly, utilities of VGAM2475 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with TAL1. The function of TAL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.20D7-FC4 (Accession XM_027578) is another VGAM2475 host target gene. 20D7-FC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by 20D7-FC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of 20D7-FC4 BINDING SITE, designated SEQ ID:30536, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83847] Another function of VGAM2475 is therefore inhibition of 20D7-FC4 (Accession XM_027578). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with 20D7-FC4. Chromosome 5 Open Reading Frame 5 (C5orf5, Accession NM_016603) is another VGAM2475 host target gene. C5orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by C5orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf5 BINDING SITE, designated SEQ ID:18695, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83848] Another function of VGAM2475 is therefore inhibition of Chromosome 5 Open Reading Frame 5 (C5orf5, Accession NM_016603). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf5. dJ309H15.1 (Accession NM_138574) is another VGAM2475 host target gene. dJ309H15.1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by dJ309H15.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of dJ309H15.1 BINDING SITE, designated SEQ ID:28886, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83849] Another function of VGAM2475 is therefore inhibition of

dJ309H15.1 (Accession NM_138574). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with dJ309H15.1. DKFZP566K1924 (Accession XM_057469) is another VGAM2475 host target gene. DKFZP566K1924 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP566K1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K1924 BINDING SITE, designated SEQ ID:36518, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83850] Another function of VGAM2475 is therefore inhibition of DKFZP566K1924 (Accession XM_057469). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K1924. FLJ11767 (Accession NM_024593) is another VGAM2475 host target gene. FLJ11767 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11767, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11767 BINDING SITE, designated SEQ ID:23829, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83851] Another function of VGAM2475 is therefore inhibition of FLJ11767 (Accession NM_024593). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11767. FLJ14596 (Accession NM_032809) is another VGAM2475 host target gene. FLJ14596 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14596 BINDING SITE, designated SEQ ID:26570, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83852] Another function of VGAM2475 is therefore inhibition of FLJ14596 (Accession NM_032809). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ14596. FLJ20375 (Accession NM_017794) is another VGAM2475 host target gene. FLJ20375 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20375, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20375 BINDING SITE, designated SEQ ID:19431, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83853] Another function of VGAM2475 is therefore inhibition of FLJ20375 (Accession NM_017794). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20375. KIAA0450 (Accession NM_014638) is another VGAM2475 host target gene. KIAA0450 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:16026, to the nucleotide sequence of VGAM2475 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5186.

[83854] Another function of VGAM2475 is therefore inhibition of KIAA0450 (Accession NM_014638). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450. KIAA1030 (Accession XM_167789) is another VGAM2475 host target gene. KIAA1030 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1030, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1030 BINDING SITE, designated SEQ ID:44817, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83855] Another function of VGAM2475 is therefore inhibition of KIAA1030 (Accession XM_167789). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1030. KIAA1045 (Accession XM_048592) is another VGAM2475 host target gene. KIAA1045 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1045, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:35191, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83856] Another function of VGAM2475 is therefore inhibition of KIAA1045 (Accession XM_048592). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045. KIAA1536 (Accession NM_020898) is another VGAM2475 host target gene. KIAA1536 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1536 BINDING SITE, designated SEQ ID:21922, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83857] Another function of VGAM2475 is therefore inhibition of KIAA1536 (Accession NM_020898). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1536. KIAA1538 (Accession XM_049474) is another VGAM2475 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35419, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83858] Another function of VGAM2475 is therefore inhibition of KIAA1538 (Accession XM_049474). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. KIAA1600 (Accession XM_049351) is another VGAM2475 host target gene. KIAA1600 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1600 BINDING SITE, designated SEQ ID:35389, to the

nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83859] Another function of VGAM2475 is therefore inhibition of KIAA1600 (Accession XM_049351). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1600. KIAA1643 (Accession XM_035371) is another VGAM2475 host target gene. KIAA1643 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1643 BINDING SITE, designated SEQ ID:32239, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83860] Another function of VGAM2475 is therefore inhibition of KIAA1643 (Accession XM_035371). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1643. MOST2 (Accession NM_020250) is another VGAM2475 host target gene. MOST2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by MOST2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOST2 BINDING SITE, designated SEQ ID:21553, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83861] Another function of VGAM2475 is therefore inhibition of MOST2 (Accession NM_020250). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOST2. Phytanoyl-CoA Hydroxylase Interacting Protein (PHYHIP, Accession NM_014759) is another VGAM2475 host target gene. PHYHIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PHYHIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHYHIP BINDING SITE, designated SEQ ID:16508, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83862] Another function of VGAM2475 is therefore inhibition of

Phytanoyl-CoA Hydroxylase Interacting Protein (PHYHIP, Accession NM_014759). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHYHIP. PR Domain Containing 8 (PRDM8, Accession NM_020226) is another VGAM2475 host target gene. PRDM8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRDM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM8 BINDING SITE, designated SEQ ID:21491, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83863] Another function of VGAM2475 is therefore inhibition of PR Domain Containing 8 (PRDM8, Accession NM_020226). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM8. SBB103 (Accession NM_005785) is another VGAM2475 host target gene. SBB103 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SBB103, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBB103 BINDING SITE, designated SEQ ID:12364, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83864] Another function of VGAM2475 is therefore inhibition of SBB103 (Accession NM_005785). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBB103. Stathmin-like 3 (STMN3, Accession NM_015894) is another VGAM2475 host target gene. STMN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STMN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STMN3 BINDING SITE, designated SEQ ID:18036, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83865] Another function of VGAM2475 is therefore inhibition of Stathmin-like 3 (STMN3, Accession NM_015894). Accordingly, utilities of VGAM2475 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with STMN3. Tigger Transposable Element Derived 1 (TIGD1, Accession XM_114293) is another VGAM2475 host target gene. TIGD1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TIGD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIGD1 BINDING SITE, designated SEQ ID:42846, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83866] Another function of VGAM2475 is therefore inhibition of Tigger Transposable Element Derived 1 (TIGD1, Accession XM_114293). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIGD1. LOC143677 (Accession XM_096471) is another VGAM2475 host target gene. LOC143677 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC143677 BINDING SITE, designated SEQ ID:40373, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83867] Another function of VGAM2475 is therefore inhibition of LOC143677 (Accession XM_096471). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143677. LOC154222 (Accession XM_098497) is another VGAM2475 host target gene. LOC154222 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154222 BINDING SITE, designated SEQ ID:41690, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83868] Another function of VGAM2475 is therefore inhibition of LOC154222 (Accession XM_098497). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154222. LOC159090 (Accession XM_088749) is an-

other VGAM2475 host target gene. LOC159090 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159090, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159090 BINDING SITE, designated SEQ ID:39938, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83869] Another function of VGAM2475 is therefore inhibition of LOC159090 (Accession XM_088749). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159090. LOC221100 (Accession XM_167753) is another VGAM2475 host target gene. LOC221100 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221100 BINDING SITE, designated SEQ ID:44776, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83870] Another function of VGAM2475 is therefore inhibition of LOC221100 (Accession XM_167753). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221100. LOC221935 (Accession XM_166537) is another VGAM2475 host target gene. LOC221935 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221935 BINDING SITE, designated SEQ ID:44498, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83871] Another function of VGAM2475 is therefore inhibition of LOC221935 (Accession XM_166537). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221935. LOC256942 (Accession XM_170544) is another VGAM2475 host target gene. LOC256942 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256942, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256942 BINDING SITE, designated SEQ ID:45363, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83872] Another function of VGAM2475 is therefore inhibition of LOC256942 (Accession XM_170544). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256942. LOC91397 (Accession XM_038219) is another VGAM2475 host target gene. LOC91397 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91397 BINDING SITE, designated SEQ ID:32779, to the nucleotide sequence of VGAM2475 RNA, herein designated VGAM RNA, also designated SEQ ID:5186.

[83873] Another function of VGAM2475 is therefore inhibition of LOC91397 (Accession XM_038219). Accordingly, utilities of VGAM2475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91397. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2476 (VGAM2476) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83874] VGAM2476 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2476 was detected is described hereinabove with reference to Figs. 1-8.

[83875] VGAM2476 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2476 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83876] VGAM2476 gene encodes a VGAM2476 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2476 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2476 precursor RNA is designated SEQ ID:2462, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2462 is located at position 136488 relative to the genome of Mouse Cytomegalovirus 1.

[83877] VGAM2476 precursor RNA folds onto itself, forming VGAM2476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83878] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2476 folded precursor RNA into VGAM2476 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2476 RNA is designated SEQ ID:5187, and is provided hereinbelow with reference to the sequence listing part.

[83879] VGAM2476 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2476 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2476 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83880] VGAM2476 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2476 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2476 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2476 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2476 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83881] The complementary binding of VGAM2476 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2476 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2476 host target RNA into VGAM2476 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83882] It is appreciated that VGAM2476 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2476 host target genes. The mRNA of each one of this plurality of VGAM2476 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2476 RNA, herein designated VGAM RNA, and which when bound by VGAM2476 RNA causes

inhibition of translation of respective one or more VGAM2476 host target proteins.

[83883] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2476 gene, herein designated VGAM GENE, on one or more VGAM2476 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83884] It is yet further appreciated that a function of VGAM2476 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2476 include diagnosis, prevention and

treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2476 correlate with, and may be deduced from, the identity of the host target genes which VGAM2476 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83885] Nucleotide sequences of the VGAM2476 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2476 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2476 are further described hereinbelow with reference to Table 1.

[83886] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2476 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2476 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83887] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2476 gene, herein designated VGAM is inhibition of expression of VGAM2476 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2476 correlate with, and may be deduced from, the identity of the target genes which VGAM2476 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83888] Paired-like Homeodomain Transcription Factor 2 (PITX2, Accession NM_000325) is a VGAM2476 host target gene. PITX2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PITX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PITX2 BINDING SITE, designated SEQ ID:5867, to the nucleotide sequence of VGAM2476 RNA, herein designated VGAM RNA, also designated SEQ ID:5187.

[83889] A function of VGAM2476 is therefore inhibition of Paired-like Homeodomain Transcription Factor 2 (PITX2, Accession NM_000325). Accordingly, utilities of VGAM2476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PITX2. Fer-1-like 4 (C. elegans) (FER1L4, Accession NM_025206) is another VGAM2476 host target gene. FER1L4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FER1L4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FER1L4 BINDING SITE, designated SEQ ID:24874, to the nucleotide sequence of VGAM2476 RNA, herein designated VGAM RNA, also designated SEQ ID:5187.

[83890] Another function of VGAM2476 is therefore inhibition of Fer-1-like 4 (C. elegans) (FER1L4, Accession NM_025206). Accordingly, utilities of VGAM2476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FER1L4. KIAA0876 (Accession XM_035625) is another VGAM2476 host target gene. KIAA0876 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0876 BINDING SITE, designated SEQ ID:32297, to the nucleotide sequence of VGAM2476 RNA, herein designated VGAM RNA, also designated SEQ ID:5187.

[83891] Another function of VGAM2476 is therefore inhibition of

KIAA0876 (Accession XM_035625). Accordingly, utilities of VGAM2476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0876. KIAA1608 (Accession NM_024820) is another VGAM2476 host target gene. KIAA1608 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1608, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1608 BINDING SITE, designated SEQ ID:24210, to the nucleotide sequence of VGAM2476 RNA, herein designated VGAM RNA, also designated SEQ ID:5187.

[83892] Another function of VGAM2476 is therefore inhibition of KIAA1608 (Accession NM_024820). Accordingly, utilities of VGAM2476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1608. LOC151124 (Accession XM_098006) is another VGAM2476 host target gene. LOC151124 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151124, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC151124 BINDING SITE, designated SEQ ID:41302, to the nucleotide sequence of VGAM2476 RNA, herein designated VGAM RNA, also designated SEQ ID:5187.

[83893] Another function of VGAM2476 is therefore inhibition of LOC151124 (Accession XM_098006). Accordingly, utilities of VGAM2476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151124. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2477 (VGAM2477) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83894] VGAM2477 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2477 was detected is described hereinabove with reference to Figs. 1-8.

[83895] VGAM2477 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2477 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[83896] VGAM2477 gene encodes a VGAM2477 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2477 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2477 precursor RNA is designated SEQ ID:2463, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2463 is located at position 205607 relative to the genome of Mouse Cytomegalovirus 1.

[83897] VGAM2477 precursor RNA folds onto itself, forming VGAM2477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83898] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2477 folded precursor RNA into VGAM2477 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2477 RNA is designated SEQ ID:5188, and is provided hereinbelow with reference to the sequence listing part.

[83899] VGAM2477 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2477 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2477 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83900] VGAM2477 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2477 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2477 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2477 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2477 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83901] The complementary binding of VGAM2477 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2477 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2477 host target RNA into VGAM2477 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83902] It is appreciated that VGAM2477 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2477 host target genes. The mRNA of each one of this plurality of VGAM2477 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2477 RNA, herein designated VGAM RNA, and which when bound by VGAM2477 RNA causes inhibition of translation of respective one or more VGAM2477 host target proteins.

[83903] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2477 gene, herein designated VGAM GENE, on one or more VGAM2477 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83904] It is yet further appreciated that a function of VGAM2477 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2477 correlate with, and may be deduced from, the identity of the host target genes which VGAM2477 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[83905] Nucleotide sequences of the VGAM2477 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2477 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2477 are further described hereinbelow with reference to Table 1.

[83906] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2477 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2477 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83907] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2477 gene, herein designated VGAM is inhibition of expression of VGAM2477 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2477 correlate with, and may be deduced from, the identity of the target genes which VGAM2477 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83908] Inositol Polyphosphate Phosphatase-like 1 (INPPL1, Accession NM_001567) is a VGAM2477 host target gene. INPPL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by INPPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPPL1 BINDING SITE, designated SEQ ID:7296, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ

ID:5188.

[83909] A function of VGAM2477 is therefore inhibition of Inositol Polyphosphate Phosphatase-like 1 (INPPL1, Accession NM_001567), a gene which hydrolyzes Ins(1,3,4,5)P4 and PtdIns(3,4,5)P3; contains an SH2-domain. Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPPL1. The function of INPPL1 has been established by previous studies. Habib et al. (1998) raised antibodies against SHIP2 to examine the effects of growth factors and insulin (OMIM Ref. No. 176730) on the metabolism of this protein. Immunoblot analysis revealed that SHIP2 was widely expressed in fibroblast and nonhematopoietic tumor cell lines, unlike the SHIP protein (OMIM Ref. No. 601582), which was found only in cell lines of hematopoietic origin. The SHIP2 antiserum precipitated a protein of approximately 145 kD, along with an activity which hydrolyzed phosphatidylinositol 3,4,5-triphosphate to phosphatidylinositol 3,4-bisphosphate. Tyrosine phosphorylation of SHIP2 occurred in response to treatment of cells with EGF, platelet-derived growth factor (PDGF; OMIM Ref. No. 190040), nerve growth factor (NGF; 162030), insulin-like growth factor-1 (IGF1; 147440), or

insulin. EGF and PDGF induced transient tyrosine phosphorylation of SHIP2, while treatment of cells with NGF, IGF1, or insulin resulted in prolonged tyrosine phosphorylation of SHIP2. Habib et al. (1998) concluded that their data suggests that SHIP2 may play a significant role in regulation of phosphatidylinositol 3-prime-kinase signaling by growth factors and insulin. By PCR using primers from the INPPL1 cDNA sequence, Hejna et al. (1995) screened an NIGMS human/rodent somatic cell hybrid mapping panel and assigned the INPPL1 gene to chromosome 11. They narrowed the localization to 11q23 using a chromosome 11-specific deletion panel Animal model experiments lend further support to the function of INPPL1. Clement et al. (2001) generated mice lacking the Ship2 gene. Loss of Ship2 led to increased sensitivity to insulin, which was characterized by severe neonatal hypoglycemia, deregulated expression of the genes involved in gluconeogenesis, and perinatal death. Adult mice that were heterozygous for the Ship2 mutation had increased glucose tolerance and insulin sensitivity associated with an increased recruitment of the GLUT4 glucose transporter (OMIM Ref. No. 138190) and increased glycogen synthesis in skeletal muscles. Clement et al. (2001) suggested that

the results show that SHIP2 is a potent negative regulator of insulin signaling and insulin sensitivity in vivo.

[83910] It is appreciated that the abovementioned animal model for INPPL1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[83911] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83912] Habib, T.; Hejna, J. A.; Moses, R. E.; Decker, S. J. : Growth factors and insulin stimulate tyrosine phosphorylation of the 51C/SHIP2 protein. J. Biol. Chem. 273: 18605-18609, 1998. ; and

[83913] Clement, S.; Krause, U.; Desmedt, F.; Tanti, J.-F.; Behrends, J.; Pesesse, X.; Sasaki, T.; Penninger, J.; Doherty, M.; Malaisse, W.; Dumont, J. E.; Le Marchand-Brustel, Y.; Erneux, C.; H.

[83914] Further studies establishing the function and utilities of INPPL1 are found in John Hopkins OMIM database record ID 600829, and in sited publications numbered 7783-7787 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Jerky Homolog-like (mouse) (JRKL, Accession NM_003772) is an-

other VGAM2477 host target gene. JRKL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by JRKL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JRKL BINDING SITE, designated SEQ ID:9856, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83915] Another function of VGAM2477 is therefore inhibition of Jerky Homolog-like (mouse) (JRKL, Accession NM_003772), a gene which is a Jerky-related protein and similar to centromere binding protein-B and other nuclear regulators. Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JRKL. The function of JRKL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1546.Neurexin 2 (NRXN2, Accession NM_015080) is another VGAM2477 host target gene. NRXN2 BINDING SITE1 through NRXN2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA en-

coded by NRXN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRXN2 BINDING SITE1 through NRXN2 BINDING SITE3, designated SEQ ID:17470, SEQ ID:28986 and SEQ ID:28991 respectively, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83916] Another function of VGAM2477 is therefore inhibition of Neurexin 2 (NRXN2, Accession NM_015080), a gene which may be involved in cell recognition, cell adhesion, and may mediate intracellular signaling. Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRXN2. The function of NRXN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.UC28 (Accession NM_021635) is another VGAM2477 host target gene. UC28 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UC28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of UC28 BINDING SITE, designated SEQ ID:22280, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83917] Another function of VGAM2477 is therefore inhibition of UC28 (Accession NM_021635). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UC28. Chromosome 9 Open Reading Frame 5 (C9orf5, Accession NM_032012) is another VGAM2477 host target gene. C9orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf5 BINDING SITE, designated SEQ ID:25716, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83918] Another function of VGAM2477 is therefore inhibition of Chromosome 9 Open Reading Frame 5 (C9orf5, Accession NM_032012). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with C9orf5. FLJ12542 (Accession NM_024899) is another VGAM2477 host target gene. FLJ12542 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12542, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12542 BINDING SITE, designated SEQ ID:24383, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83919] Another function of VGAM2477 is therefore inhibition of FLJ12542 (Accession NM_024899). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12542. Golgi Phosphoprotein 2 (GOLPH2, Accession NM_016548) is another VGAM2477 host target gene. GOLPH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GOLPH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH2 BINDING SITE, designated SEQ

ID:18625, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83920] Another function of VGAM2477 is therefore inhibition of Golgi Phosphoprotein 2 (GOLPH2, Accession NM_016548). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH2. HTEX4 (Accession XM_175165) is another VGAM2477 host target gene. HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HTEX4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3, designated SEQ ID:46653, SEQ ID:46722 and SEQ ID:44217 respectively, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83921] Another function of VGAM2477 is therefore inhibition of HTEX4 (Accession XM_175165). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTEX4.

KIAA0557 (Accession XM_085507) is another VGAM2477 host target gene. KIAA0557 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38209, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83922] Another function of VGAM2477 is therefore inhibition of KIAA0557 (Accession XM_085507). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. KIAA0783 (Accession NM_014660) is another VGAM2477 host target gene. KIAA0783 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0783 BINDING SITE, designated SEQ ID:16105, to the nucleotide sequence of VGAM2477 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5188.

[83923] Another function of VGAM2477 is therefore inhibition of KIAA0783 (Accession NM_014660). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0783. KIAA1143 (Accession XM_044014) is another VGAM2477 host target gene. KIAA1143 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:34076, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83924] Another function of VGAM2477 is therefore inhibition of KIAA1143 (Accession XM_044014). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1143. KIAA1432 (Accession XM_039698) is another VGAM2477 host target gene. KIAA1432 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1432, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1432 BINDING SITE, designated SEQ ID:33152, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83925] Another function of VGAM2477 is therefore inhibition of KIAA1432 (Accession XM_039698). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1432. Protocadherin 20 (PCDH20, Accession NM_022843) is another VGAM2477 host target gene. PCDH20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDH20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH20 BINDING SITE, designated SEQ ID:23137, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83926] Another function of VGAM2477 is therefore inhibition of Protocadherin 20 (PCDH20, Accession NM_022843). Ac-

cordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH20. PRO2533 (Accession NM_018629) is another VGAM2477 host target gene. PRO2533 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2533 BINDING SITE, designated SEQ ID:20704, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83927] Another function of VGAM2477 is therefore inhibition of PRO2533 (Accession NM_018629). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2533. LOC118851 (Accession XM_061180) is another VGAM2477 host target gene. LOC118851 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC118851, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC118851 BINDING SITE, designated SEQ ID:37203, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83928] Another function of VGAM2477 is therefore inhibition of LOC118851 (Accession XM_061180). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118851. LOC127943 (Accession XM_059195) is another VGAM2477 host target gene. LOC127943 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC127943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127943 BINDING SITE, designated SEQ ID:36914, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83929] Another function of VGAM2477 is therefore inhibition of LOC127943 (Accession XM_059195). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127943. LOC143154 (Accession XM_084441) is an-

other VGAM2477 host target gene. LOC143154 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143154 BINDING SITE, designated SEQ ID:37590, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83930] Another function of VGAM2477 is therefore inhibition of LOC143154 (Accession XM_084441). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143154. LOC169966 (Accession XM_093010) is another VGAM2477 host target gene. LOC169966 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC169966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169966 BINDING SITE, designated SEQ ID:40167, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83931] Another function of VGAM2477 is therefore inhibition of LOC169966 (Accession XM_093010). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169966. LOC219294 (Accession XM_167566) is another VGAM2477 host target gene. LOC219294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219294 BINDING SITE, designated SEQ ID:44690, to the nucleotide sequence of VGAM2477 RNA, herein designated VGAM RNA, also designated SEQ ID:5188.

[83932] Another function of VGAM2477 is therefore inhibition of LOC219294 (Accession XM_167566). Accordingly, utilities of VGAM2477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219294. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2478 (VGAM2478) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[83933] VGAM2478 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2478 was detected is described hereinabove with reference to Figs. 1-8.

[83934] VGAM2478 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2478 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83935] VGAM2478 gene encodes a VGAM2478 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2478 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2478 precursor RNA is designated SEQ ID:2464, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2464 is located at position 55947 relative to the genome of Mouse Cytomegalovirus 1.

[83936] VGAM2478 precursor RNA folds onto itself, forming VGAM2478 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83937] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2478 folded precursor RNA into VGAM2478 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2478 RNA is designated SEQ ID:5189, and is provided hereinbelow with reference to the sequence listing part.

[83938] VGAM2478 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2478 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2478 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83939] VGAM2478 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2478 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2478 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2478 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2478 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83940] The complementary binding of VGAM2478 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2478 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2478 host target RNA into VGAM2478 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83941] It is appreciated that VGAM2478 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2478 host target genes. The mRNA of each one of this plurality of VGAM2478 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2478 RNA, herein designated VGAM RNA, and which when bound by VGAM2478 RNA causes inhibition of translation of respective one or more VGAM2478 host target proteins.

[83942] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2478 gene, herein designated VGAM GENE, on one or more VGAM2478 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83943] It is yet further appreciated that a function of VGAM2478 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2478 correlate with, and may be deduced from, the identity of the host target genes which VGAM2478 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[83944] Nucleotide sequences of the VGAM2478 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2478 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2478 are further described hereinbelow with reference to Table 1.

[83945] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2478 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2478 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83946] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2478 gene, herein designated VGAM is inhibition of expression of VGAM2478 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2478 correlate with, and may be deduced from, the identity of the target genes which VGAM2478 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83947] Ras Homolog Gene Family, Member H (ARHH, Accession NM_004310) is a VGAM2478 host target gene. ARHH BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARHH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHH BINDING SITE, designated SEQ ID:10516, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83948] A function of VGAM2478 is therefore inhibition of Ras Homolog Gene Family, Member H (ARHH, Accession NM_004310), a gene which is a member of the Ras superfamily of small GTPases. Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHH. The function of ARHH has been established by previous studies. Non-Hodgkin lymphoma (NHL; OMIM Ref. No. 605027) is associated with several translocations between the LAZ3 (OMIM Ref. No. 109565) oncogene at 3q27 and other unrelated genes. Dallery et al. (1995) stated that translocations involving band 3q27 and the immunoglobulin (Ig) genes are the third most common specific abnor-

mality associated with NHL. LAZ3 rearrangements also occur in several NHLs without the involvement of Ig genes, as in the translocation t(3;4)(q27;p11) observed in the B-cell line VAL. Dallery et al. (1995) demonstrated that the consequence of this translocation is the expression of a chimeric transcript of LAZ3 and a new gene, which they termed TTF for 'translocation three four,' encoding a small G-like protein. Analysis of a full-length TTF cDNA revealed that the gene encodes a 191-amino acid polypeptide with similarity to members of the Ras superfamily (see OMIM Ref. No. 139150). The highest degree of identity was found with the Rho-like CDC42 protein (OMIM Ref. No. 116952). Dallery et al. (1995) reported that the sequence contains residues normally associated with binding and hydrolysis of guanosine triphosphate. Northern blot analysis showed that TTF is expressed in hemopoietic cell lines only. Dallery-Prudhomme et al. (1997) examined the genomic organization of the RhoH/TTF gene and demonstrated that it is encoded on 2 exons spanning 35 kb of the genome. The entire coding region resides on the second exon. Dallery-Prudhomme et al. (1997) used fluorescence in situ hybridization to map the gene to chromosome 4p13. See also ARHA (OMIM Ref. No.

165390). In addition to immunoglobulin V genes, the 5-prime sequences of BCL6 (OMIM Ref. No. 109565) and FAS (TNFRSF6; 134637) are mutated in normal germinal center B lymphocytes. Genomic instability promotes tumorigenesis through defective chromosome segregation and DNA mismatch repair inactivation. By screening 18 loci for mutations, Pasqualucci et al. (2001) identified changes in the germline sequences of PIM1 (OMIM Ref. No. 164960), MYC (OMIM Ref. No. 190080), ARHH, and/or PAX5 (OMIM Ref. No. 167414), in addition to BCL6, in a majority of diffuse large-cell lymphomas (DLCLs; OMIM Ref. No. 601889). No mutations in PIM1, MYC, ARHH, and PAX5 were detected in germinal-center lymphocytes, naive B cells, or B-cell malignancies other than DLCLs. ARHH mutations, which were observed in 46% of DLCLs, resided within noncoding sequences, suggesting an effect on regulation of ARHH expression. FISH analysis indicated that hypermutation in these genes is not due to chromosomal translocation, as seen in Burkitt lymphoma (OMIM Ref. No. 113970). Chromosomal translocation, however, may be an outcome of hypermutation. Specific features of the hypermutation process, including the predominance of single nucleotide substitutions with occasional dele-

tions or duplications, a preference for transitions over transversions, and a specific motif targeting RGYW, were recognizable in each of the hypermutated loci. Pasqualucci et al. (2001) proposed that aberrant hypermutation of regulatory and coding sequences of genes that do not represent physiologic targets may provide the basis for DLCL pathogenesis and explain its phenotypic and clinical heterogeneity. This hypermutation malfunction is unlikely to be due to defective DNA mismatch repair and does not appear to involve activation-induced deaminase (AICDA; 605257)

[83949] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[83950] Dallery, E.; Galiegue-Zouitina, S.; Collyn-d'Hooghe, M.; Quief, S.; Denis, C.; Hildebrand, M.-P.; Lantoine, D.; Deweindt, C.; Tilly, H.; Bastard, C.; Kerckaert, J.-P. : TTF, a gene encoding a novel small G protein, fuses to the lymphoma-associated LAZ3 gene by t(3;4) chromosomal translocation. Oncogene 10: 2171-2178, 1995. ; and

[83951] Pasqualucci, L.; Neumeister, P.; Goossens, T.; Nanjangud, G.; Chaganti, R. S. K.; Kuppers, R.; Dalla-Favera, R. : Hypermutation of multiple proto-oncogenes in B-cell diffuse

large-cell.

[83952] Further studies establishing the function and utilities of ARHH are found in John Hopkins OMIM database record ID 602037, and in sited publications numbered 951-95 and 11110 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Myxovirus (influenza virus) Resistance 1, Interferon-inducible Protein P78 (mouse) (MX1, Accession NM_002462) is another VGAM2478 host target gene. MX1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MX1 BINDING SITE, designated SEQ ID:8293, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83953] Another function of VGAM2478 is therefore inhibition of Myxovirus (influenza virus) Resistance 1, Interferon-inducible Protein P78 (mouse) (MX1, Accession NM_002462), a gene which is responsible for a specific antiviral state against influenza virus infection. Accordingly, utilities of VGAM2478 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with MX1. The function of MX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM973.V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM_034274) is another VGAM2478 host target gene. MYBL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MYBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYBL1 BINDING SITE, designated SEQ ID:32043, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83954] Another function of VGAM2478 is therefore inhibition of V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM_034274), a gene which could have a role in the proliferation and/or differentiation of neurogenic, spermatogenic and b-lymphoid cells. Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with MYBL1. The function of MYBL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM184.Synaptogyrin 3 (SYNGR3, Accession NM_004209) is another VGAM2478 host target gene. SYNGR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYNGR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR3 BINDING SITE, designated SEQ ID:10408, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83955] Another function of VGAM2478 is therefore inhibition of Synaptogyrin 3 (SYNGR3, Accession NM_004209). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR3. Cyclin M2 (CNNM2, Accession NM_017649) is another VGAM2478 host target gene. CNNM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

CNNM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM2 BINDING SITE, designated SEQ ID:19154, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83956] Another function of VGAM2478 is therefore inhibition of Cyclin M2 (CNNM2, Accession NM_017649). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM2. FLJ10759 (Accession NM_018207) is another VGAM2478 host target gene. FLJ10759 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10759 BINDING SITE, designated SEQ ID:20102, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83957] Another function of VGAM2478 is therefore inhibition of FLJ10759 (Accession NM_018207). Accordingly, utilities of

VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10759. FLJ20507 (Accession XM_012558) is another VGAM2478 host target gene. FLJ20507 BINDING SITE1 and FLJ20507 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20507, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20507 BINDING SITE1 and FLJ20507 BINDING SITE2, designated SEQ ID:30219 and SEQ ID:19511 respectively, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83958] Another function of VGAM2478 is therefore inhibition of FLJ20507 (Accession XM_012558). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20507. KIAA1656 (Accession XM_038022) is another VGAM2478 host target gene. KIAA1656 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:32734, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83959] Another function of VGAM2478 is therefore inhibition of KIAA1656 (Accession XM_038022). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. KIAA1912 (Accession XM_055636) is another VGAM2478 host target gene. KIAA1912 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1912 BINDING SITE, designated SEQ ID:36312, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83960] Another function of VGAM2478 is therefore inhibition of KIAA1912 (Accession XM_055636). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1912. KIAA1940 (Accession XM_086981) is another VGAM2478 host target gene. KIAA1940 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1940 BINDING SITE, designated SEQ ID:39006, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83961] Another function of VGAM2478 is therefore inhibition of KIAA1940 (Accession XM_086981). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1940. MGC4309 (Accession NM_024115) is another VGAM2478 host target gene. MGC4309 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4309 BINDING SITE, designated SEQ ID:23568, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM

RNA, also designated SEQ ID:5189.

[83962] Another function of VGAM2478 is therefore inhibition of MGC4309 (Accession NM_024115). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4309. MAP Kinase-interacting Serine/threonine Kinase 1 (MKNK1, Accession NM_003684) is another VGAM2478 host target gene. MKNK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MKNK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKNK1 BINDING SITE, designated SEQ ID:9793, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83963] Another function of VGAM2478 is therefore inhibition of MAP Kinase-interacting Serine/threonine Kinase 1 (MKNK1, Accession NM_003684). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKNK1. poly(A) Binding Protein, Cytoplasmic 5 (PABPC5, Accession NM_080832) is another VGAM2478 host target

gene. PABPC5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PABPC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PABPC5 BINDING SITE, designated SEQ ID:28097, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83964] Another function of VGAM2478 is therefore inhibition of poly(A) Binding Protein, Cytoplasmic 5 (PABPC5, Accession NM_080832). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PABPC5. Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM_003559) is another VGAM2478 host target gene. PIP5K2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIP5K2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K2B BINDING SITE, designated SEQ ID:9612, to the nucleotide sequence of VGAM2478 RNA,

herein designated VGAM RNA, also designated SEQ ID:5189.

[83965] Another function of VGAM2478 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM_003559). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2B. SCYD1 (Accession XM_165650) is another VGAM2478 host target gene. SCYD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCYD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYD1 BINDING SITE, designated SEQ ID:43710, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83966] Another function of VGAM2478 is therefore inhibition of SCYD1 (Accession XM_165650). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYD1. SEC14-like 1 (S. cerevisiae) (SEC14L1, Accession NM_003003) is another VGAM2478 host target gene.

SEC14L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC14L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC14L1 BINDING SITE, designated SEQ ID:8904, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83967] Another function of VGAM2478 is therefore inhibition of SEC14-like 1 (S. cerevisiae) (SEC14L1, Accession NM_003003). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC14L1. SMURF2 (Accession NM_022739) is another VGAM2478 host target gene. SMURF2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SMURF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMURF2 BINDING SITE, designated SEQ ID:22946, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ

ID:5189.

[83968] Another function of VGAM2478 is therefore inhibition of SMURF2 (Accession NM_022739). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMURF2. LOC115704 (Accession XM_056533) is another VGAM2478 host target gene. LOC115704 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115704 BINDING SITE, designated SEQ ID:36402, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83969] Another function of VGAM2478 is therefore inhibition of LOC115704 (Accession XM_056533). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115704. LOC124602 (Accession XM_058829) is another VGAM2478 host target gene. LOC124602 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124602, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124602 BINDING SITE, designated SEQ ID:36760, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83970] Another function of VGAM2478 is therefore inhibition of LOC124602 (Accession XM_058829). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124602. LOC147299 (Accession XM_085763) is another VGAM2478 host target gene. LOC147299 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147299 BINDING SITE, designated SEQ ID:38332, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83971] Another function of VGAM2478 is therefore inhibition of LOC147299 (Accession XM_085763). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC147299. LOC149194 (Accession XM_086458) is another VGAM2478 host target gene. LOC149194 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149194 BINDING SITE, designated SEQ ID:38671, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83972] Another function of VGAM2478 is therefore inhibition of LOC149194 (Accession XM_086458). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149194. LOC151521 (Accession XM_098076) is another VGAM2478 host target gene. LOC151521 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151521, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151521 BINDING SITE, designated SEQ ID:41367, to

the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83973] Another function of VGAM2478 is therefore inhibition of LOC151521 (Accession XM_098076). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151521. LOC157349 (Accession XM_088298) is another VGAM2478 host target gene. LOC157349 BINDING SITE1 through LOC157349 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC157349, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE1 through LOC157349 BINDING SITE3, designated SEQ ID:39590, SEQ ID:39591 and SEQ ID:39592 respectively, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83974] Another function of VGAM2478 is therefore inhibition of LOC157349 (Accession XM_088298). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349. LOC220110 (Accession XM_167882) is an-

other VGAM2478 host target gene. LOC220110 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220110 BINDING SITE, designated SEQ ID:44894, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83975] Another function of VGAM2478 is therefore inhibition of LOC220110 (Accession XM_167882). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220110. LOC222031 (Accession XM_168371) is another VGAM2478 host target gene. LOC222031 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222031 BINDING SITE, designated SEQ ID:45133, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83976] Another function of VGAM2478 is therefore inhibition of LOC222031 (Accession XM_168371). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222031. LOC92578 (Accession XM_045900) is another VGAM2478 host target gene. LOC92578 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92578, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92578 BINDING SITE, designated SEQ ID:34607, to the nucleotide sequence of VGAM2478 RNA, herein designated VGAM RNA, also designated SEQ ID:5189.

[83977] Another function of VGAM2478 is therefore inhibition of LOC92578 (Accession XM_045900). Accordingly, utilities of VGAM2478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92578. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2479 (VGAM2479) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[83978] VGAM2479 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2479 was detected is described hereinabove with reference to Figs. 1-8.

[83979] VGAM2479 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2479 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[83980] VGAM2479 gene encodes a VGAM2479 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2479 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2479 precursor RNA is designated SEQ ID:2465, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2465 is located at position 167759 relative to the genome of Mouse Cytomegalovirus 1.

[83981] VGAM2479 precursor RNA folds onto itself, forming VGAM2479 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[83982] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2479 folded precursor RNA into VGAM2479 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2479 RNA is designated SEQ ID:5190, and is provided hereinbelow with reference to the sequence listing part.

[83983] VGAM2479 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2479 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2479 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[83984] VGAM2479 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2479 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2479 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2479 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2479 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[83985] The complementary binding of VGAM2479 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2479 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2479 host target RNA into VGAM2479 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[83986] It is appreciated that VGAM2479 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2479 host target genes. The mRNA of each one of this plurality of VGAM2479 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2479 RNA, herein designated VGAM RNA, and which when bound by VGAM2479 RNA causes inhibition of translation of respective one or more VGAM2479 host target proteins.

[83987] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2479 gene, herein designated VGAM GENE, on one or more VGAM2479 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[83988] It is yet further appreciated that a function of VGAM2479 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2479 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2479 correlate with, and may be deduced from, the identity of the host target genes which VGAM2479 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[83989] Nucleotide sequences of the VGAM2479 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2479 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2479 are further described hereinbelow with reference to Table 1.

[83990] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2479 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2479 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[83991] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2479 gene, herein designated VGAM is inhibition of expression of VGAM2479 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2479 correlate with, and may be deduced from, the identity of the target genes which VGAM2479 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[83992] Vasoactive Intestinal Peptide Receptor 1 (VIPR1, Accession NM_004624) is a VGAM2479 host target gene. VIPR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VIPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIPR1 BINDING SITE, designated SEQ ID:10994, to the nucleotide sequence of VGAM2479 RNA, herein designated VGAM RNA, also designated SEQ ID:5190.

[83993] A function of VGAM2479 is therefore inhibition of Vasoactive Intestinal Peptide Receptor 1 (VIPR1, Accession NM_004624), a gene which binds vip and is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM2479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIPR1. The function of VIPR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM548.DKFZp762E1511 (Accession XM_003460) is another VGAM2479 host target gene. DKFZp762E1511 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

DKFZp762E1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1511 BINDING SITE, designated SEQ ID:29931, to the nucleotide sequence of VGAM2479 RNA, herein designated VGAM RNA, also designated SEQ ID:5190.

[83994] Another function of VGAM2479 is therefore inhibition of DKFZp762E1511 (Accession XM_003460). Accordingly, utilities of VGAM2479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1511. LOC123242 (Accession XM_063548) is another VGAM2479 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:37245, to the nucleotide sequence of VGAM2479 RNA, herein designated VGAM RNA, also designated SEQ ID:5190.

[83995] Another function of VGAM2479 is therefore inhibition of

LOC123242 (Accession XM_063548). Accordingly, utilities of VGAM2479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123242. LOC139248 (Accession XM_066582) is another VGAM2479 host target gene. LOC139248 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC139248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139248 BINDING SITE, designated SEQ ID:37337, to the nucleotide sequence of VGAM2479 RNA, herein designated VGAM RNA, also designated SEQ ID:5190.

[83996] Another function of VGAM2479 is therefore inhibition of LOC139248 (Accession XM_066582). Accordingly, utilities of VGAM2479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139248. LOC196955 (Accession XM_085210) is another VGAM2479 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37937, to the nucleotide sequence of VGAM2479 RNA, herein designated VGAM RNA, also designated SEQ ID:5190.

[83997] Another function of VGAM2479 is therefore inhibition of LOC196955 (Accession XM_085210). Accordingly, utilities of VGAM2479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC253216 (Accession XM_170765) is another VGAM2479 host target gene. LOC253216 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253216 BINDING SITE, designated SEQ ID:45516, to the nucleotide sequence of VGAM2479 RNA, herein designated VGAM RNA, also designated SEQ ID:5190.

[83998] Another function of VGAM2479 is therefore inhibition of LOC253216 (Accession XM_170765). Accordingly, utilities of VGAM2479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253216. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2480 (VGAM2480) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[83999] VGAM2480 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2480 was detected is described hereinabove with reference to Figs. 1-8.

[84000] VGAM2480 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2480 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84001] VGAM2480 gene encodes a VGAM2480 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2480 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2480 precursor RNA is designated SEQ ID:2466, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2466 is located at position 131305 relative to the genome of Mouse Cytomegalovirus 1.

[84002] VGAM2480 precursor RNA folds onto itself, forming VGAM2480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84003] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2480 folded precursor RNA into VGAM2480 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2480 RNA is designated SEQ ID:5191, and is provided hereinbelow with reference to the sequence listing part.

[84004] VGAM2480 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2480 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2480 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84005] VGAM2480 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2480 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2480 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2480 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2480 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84006] The complementary binding of VGAM2480 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2480 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2480 host target RNA into VGAM2480 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84007] It is appreciated that VGAM2480 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2480 host target genes. The mRNA of each one of this plurality of VGAM2480 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2480 RNA, herein designated VGAM RNA, and which when bound by VGAM2480 RNA causes inhibition of translation of respective one or more

VGAM2480 host target proteins.

[84008] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2480 gene, herein designated VGAM GENE, on one or more VGAM2480 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84009] It is yet further appreciated that a function of VGAM2480 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2480 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1.

Specific functions, and accordingly utilities, of VGAM2480 correlate with, and may be deduced from, the identity of the host target genes which VGAM2480 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84010] Nucleotide sequences of the VGAM2480 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2480 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2480 are further described hereinbelow with reference to Table 1.

[84011] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2480 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2480 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84012] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2480 gene, herein designated VGAM is inhibition of expression of VGAM2480 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2480 correlate with, and may be deduced from, the identity of the target genes which VGAM2480 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84013] LOC155376 (Accession XM_088240) is a VGAM2480 host target gene. LOC155376 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC155376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155376 BINDING SITE, designated SEQ ID:39563, to the nucleotide sequence of VGAM2480 RNA, herein designated VGAM RNA, also designated SEQ ID:5191.

[84014] A function of VGAM2480 is therefore inhibition of LOC155376 (Accession XM_088240). Accordingly, utilities of VGAM2480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155376. LOC219513 (Accession XM_169166) is another VGAM2480 host target gene. LOC219513 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219513, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219513 BINDING SITE, designated SEQ ID:45289, to the nucleotide sequence of VGAM2480 RNA, herein designated VGAM RNA, also designated SEQ ID:5191.

[84015] Another function of VGAM2480 is therefore inhibition of LOC219513 (Accession XM_169166). Accordingly, utilities of VGAM2480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219513. LOC222233 (Accession XM_168560) is another VGAM2480 host target gene. LOC222233 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222233 BINDING SITE, designated SEQ ID:45241, to the nucleotide sequence of VGAM2480 RNA, herein designated VGAM RNA, also designated SEQ ID:5191.

[84016] Another function of VGAM2480 is therefore inhibition of LOC222233 (Accession XM_168560). Accordingly, utilities of VGAM2480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC222233. LOC253532 (Accession XM_171152) is another VGAM2480 host target gene. LOC253532 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253532 BINDING SITE, designated SEQ ID:45949, to the nucleotide sequence of VGAM2480 RNA, herein designated VGAM RNA, also designated SEQ ID:5191.

[84017] Another function of VGAM2480 is therefore inhibition of LOC253532 (Accession XM_171152). Accordingly, utilities of VGAM2480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253532. LOC254875 (Accession XM_171170) is another VGAM2480 host target gene. LOC254875 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254875, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254875 BINDING SITE, designated SEQ ID:45953, to the nucleotide sequence of VGAM2480 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5191.

[84018] Another function of VGAM2480 is therefore inhibition of LOC254875 (Accession XM_171170). Accordingly, utilities of VGAM2480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254875. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2481 (VGAM2481) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84019] VGAM2481 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2481 was detected is described hereinabove with reference to Figs. 1-8.

[84020] VGAM2481 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2481 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84021] VGAM2481 gene encodes a VGAM2481 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2481 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2481 precursor RNA is designated SEQ ID:2467, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2467 is located at position 96988 relative to the genome of Mouse Cytomegalovirus 1.

[84022] VGAM2481 precursor RNA folds onto itself, forming VGAM2481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84023] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2481 folded precursor RNA into VGAM2481 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM2481 RNA is designated SEQ ID:5192, and is provided hereinbelow with reference to the sequence listing part.

[84024] VGAM2481 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2481 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2481 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84025] VGAM2481 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2481 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2481 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2481 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2481 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84026] The complementary binding of VGAM2481 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2481 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2481 host target RNA into VGAM2481 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84027] It is appreciated that VGAM2481 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2481 host target genes. The mRNA of

each one of this plurality of VGAM2481 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2481 RNA, herein designated VGAM RNA, and which when bound by VGAM2481 RNA causes inhibition of translation of respective one or more VGAM2481 host target proteins.

[84028] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2481 gene, herein designated VGAM GENE, on one or more VGAM2481 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[84029] It is yet further appreciated that a function of VGAM2481 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2481 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2481 correlate with, and may be deduced from, the identity of the host target genes which VGAM2481 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84030] Nucleotide sequences of the VGAM2481 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2481 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2481 are further described hereinbelow with reference to Table 1.

[84031] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2481 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2481 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84032] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2481 gene, herein designated VGAM is inhibition of expression of VGAM2481 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2481 correlate with, and may be deduced from, the identity of the target genes which VGAM2481 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84033] EH-domain Containing 2 (EHD2, Accession NM_014601) is a VGAM2481 host target gene. EHD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EHD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHD2 BINDING SITE, designated SEQ ID:15961, to the nucleotide sequence of VGAM2481 RNA, herein designated VGAM RNA, also designated SEQ ID:5192.

[84034] A function of VGAM2481 is therefore inhibition of EH-domain Containing 2 (EHD2, Accession NM_014601). Accordingly, utilities of VGAM2481 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with EHD2. NORE1 (Accession NM_031437) is another VGAM2481 host target gene. NORE1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NORE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NORE1 BINDING SITE, designated SEQ ID:25442, to the nucleotide sequence of VGAM2481 RNA, herein designated VGAM RNA, also designated SEQ ID:5192.

[84035] Another function of VGAM2481 is therefore inhibition of NORE1 (Accession NM_031437), a gene which may modulate intracellular signal transduction pathways. Accordingly, utilities of VGAM2481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NORE1. The function of NORE1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276.Nuclear Receptor Subfamily 5, Group A, Member 2 (NR5A2, Accession NM_003822) is another VGAM2481 host target gene. NR5A2 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by NR5A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR5A2 BINDING SITE, designated SEQ ID:9913, to the nucleotide sequence of VGAM2481 RNA, herein designated VGAM RNA, also designated SEQ ID:5192.

[84036] Another function of VGAM2481 is therefore inhibition of Nuclear Receptor Subfamily 5, Group A, Member 2 (NR5A2, Accession NM_003822), a gene which is a member of nuclear receptor superfamily of trancriptional activators and activates the hepatitis B virus (HBV) promoter. Accordingly, utilities of VGAM2481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR5A2. The function of NR5A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM375.DKFZP566H073 (Accession NM_015528) is another VGAM2481 host target gene. DKFZP566H073 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP566H073,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566H073 BINDING SITE, designated SEQ ID:17796, to the nucleotide sequence of VGAM2481 RNA, herein designated VGAM RNA, also designated SEQ ID:5192.

[84037] Another function of VGAM2481 is therefore inhibition of DKFZP566H073 (Accession NM_015528). Accordingly, utilities of VGAM2481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566H073. FLJ20514 (Accession NM_017856) is another VGAM2481 host target gene. FLJ20514 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20514 BINDING SITE, designated SEQ ID:19533, to the nucleotide sequence of VGAM2481 RNA, herein designated VGAM RNA, also designated SEQ ID:5192.

[84038] Another function of VGAM2481 is therefore inhibition of FLJ20514 (Accession NM_017856). Accordingly, utilities of

VGAM2481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20514. KIAA1879 (Accession XM_056635) is another VGAM2481 host target gene. KIAA1879 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1879 BINDING SITE, designated SEQ ID:36413, to the nucleotide sequence of VGAM2481 RNA, herein designated VGAM RNA, also designated SEQ ID:5192.

[84039] Another function of VGAM2481 is therefore inhibition of KIAA1879 (Accession XM_056635). Accordingly, utilities of VGAM2481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1879. Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792) is another VGAM2481 host target gene. PTPNS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PTPNS1 BINDING SITE, designated SEQ ID:28053, to the nucleotide sequence of VGAM2481 RNA, herein designated VGAM RNA, also designated SEQ ID:5192.

[84040] Another function of VGAM2481 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792). Accordingly, utilities of VGAM2481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPNS1. LOC124930 (Accession XM_058867) is another VGAM2481 host target gene. LOC124930 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC124930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124930 BINDING SITE, designated SEQ ID:36768, to the nucleotide sequence of VGAM2481 RNA, herein designated VGAM RNA, also designated SEQ ID:5192.

[84041] Another function of VGAM2481 is therefore inhibition of LOC124930 (Accession XM_058867). Accordingly, utilities of VGAM2481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC124930. LOC147160 (Accession XM_097202) is another VGAM2481 host target gene. LOC147160 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147160 BINDING SITE, designated SEQ ID:40808, to the nucleotide sequence of VGAM2481 RNA, herein designated VGAM RNA, also designated SEQ ID:5192.

[84042] Another function of VGAM2481 is therefore inhibition of LOC147160 (Accession XM_097202). Accordingly, utilities of VGAM2481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147160. LOC147669 (Accession XM_097262) is another VGAM2481 host target gene. LOC147669 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147669 BINDING SITE, designated SEQ ID:40854, to the nucleotide sequence of VGAM2481 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5192.

[84043] Another function of VGAM2481 is therefore inhibition of LOC147669 (Accession XM_097262). Accordingly, utilities of VGAM2481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147669. LOC163682 (Accession XM_099402) is another VGAM2481 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42094, to the nucleotide sequence of VGAM2481 RNA, herein designated VGAM RNA, also designated SEQ ID:5192.

[84044] Another function of VGAM2481 is therefore inhibition of LOC163682 (Accession XM_099402). Accordingly, utilities of VGAM2481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163682. LOC90342 (Accession XM_031009) is another VGAM2481 host target gene. LOC90342 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90342, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90342 BINDING SITE, designated SEQ ID:31250, to the nucleotide sequence of VGAM2481 RNA, herein designated VGAM RNA, also designated SEQ ID:5192.

[84045] Another function of VGAM2481 is therefore inhibition of LOC90342 (Accession XM_031009). Accordingly, utilities of VGAM2481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90342. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2482 (VGAM2482) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84046] VGAM2482 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2482 was detected is described hereinabove with reference to Figs. 1-8.

[84047] VGAM2482 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus

1. VGAM2482 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84048] VGAM2482 gene encodes a VGAM2482 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2482 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2482 precursor RNA is designated SEQ ID:2468, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2468 is located at position 182861 relative to the genome of Mouse Cytomegalovirus 1.

[84049] VGAM2482 precursor RNA folds onto itself, forming VGAM2482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84050] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2482 folded precursor RNA into VGAM2482 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2482 RNA is designated SEQ ID:5193, and is provided hereinbelow with reference to the sequence listing part.

[84051] VGAM2482 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2482 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2482 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84052] VGAM2482 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2482 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2482 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2482 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2482 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84053] The complementary binding of VGAM2482 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2482 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2482 host target RNA into VGAM2482 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84054] It is appreciated that VGAM2482 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2482 host target genes. The mRNA of each one of this plurality of VGAM2482 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2482 RNA, herein designated VGAM RNA, and which when bound by VGAM2482 RNA causes inhibition of translation of respective one or more VGAM2482 host target proteins.

[84055] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2482 gene, herein designated VGAM GENE, on one or more VGAM2482 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84056] It is yet further appreciated that a function of VGAM2482 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2482 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2482 correlate with, and may be deduced from, the identity of the host target genes which VGAM2482 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84057] Nucleotide sequences of the VGAM2482 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2482 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2482 are further described hereinbelow with reference to Table 1.

[84058] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2482 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2482 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84059] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2482 gene, herein designated VGAM is inhibition of expression of VGAM2482 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2482 correlate with, and may be deduced from, the identity of the target genes which VGAM2482 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84060] DiGeorge Syndrome Critical Region Gene 2 (DGCR2, Accession NM_005137) is a VGAM2482 host target gene. DGCR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DGCR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGCR2 BINDING SITE, designated SEQ

ID:11614, to the nucleotide sequence of VGAM2482 RNA, herein designated VGAM RNA, also designated SEQ ID:5193.

[84061] A function of VGAM2482 is therefore inhibition of DiGeorge Syndrome Critical Region Gene 2 (DGCR2, Accession NM_005137), a gene which could intervene in cell-cell or cell-matrix interactions. Accordingly, utilities of VGAM2482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGCR2. The function of DGCR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1485.Arginyl Aminopeptidase (aminopeptidase B)-like 1 (RNPEPL1, Accession NM_018226) is another VGAM2482 host target gene. RNPEPL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNPEPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNPEPL1 BINDING SITE, designated SEQ ID:20161, to the nucleotide sequence of VGAM2482 RNA, herein designated VGAM RNA, also designated SEQ ID:5193.

[84062] Another function of VGAM2482 is therefore inhibition of Arginyl Aminopeptidase (aminopeptidase B)-like 1 (RNPEPL1, Accession NM_018226). Accordingly, utilities of VGAM2482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPEPL1. Cyclin M1 (CNNM1, Accession NM_020348) is another VGAM2482 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21608, to the nucleotide sequence of VGAM2482 RNA, herein designated VGAM RNA, also designated SEQ ID:5193.

[84063] Another function of VGAM2482 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM_020348). Accordingly, utilities of VGAM2482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. DKFZP564D166 (Accession NM_030658) is another VGAM2482 host target gene. DKFZP564D166 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DK-

FZP564D166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D166 BINDING SITE, designated SEQ ID:24991, to the nucleotide sequence of VGAM2482 RNA, herein designated VGAM RNA, also designated SEQ ID:5193.

[84064] Another function of VGAM2482 is therefore inhibition of DKFZP564D166 (Accession NM_030658). Accordingly, utilities of VGAM2482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D166. FLJ12057 (Accession NM_024768) is another VGAM2482 host target gene. FLJ12057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12057 BINDING SITE, designated SEQ ID:24125, to the nucleotide sequence of VGAM2482 RNA, herein designated VGAM RNA, also designated SEQ ID:5193.

[84065] Another function of VGAM2482 is therefore inhibition of FLJ12057 (Accession NM_024768). Accordingly, utilities of

VGAM2482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12057. SS-56 (Accession XM_006063) is another VGAM2482 host target gene. SS-56 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SS-56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS-56 BINDING SITE, designated SEQ ID:29989, to the nucleotide sequence of VGAM2482 RNA, herein designated VGAM RNA, also designated SEQ ID:5193.

[84066] Another function of VGAM2482 is therefore inhibition of SS-56 (Accession XM_006063). Accordingly, utilities of VGAM2482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS-56. LOC147515 (Accession XM_097243) is another VGAM2482 host target gene. LOC147515 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC147515 BINDING SITE, designated SEQ ID:40842, to the nucleotide sequence of VGAM2482 RNA, herein designated VGAM RNA, also designated SEQ ID:5193.

[84067] Another function of VGAM2482 is therefore inhibition of LOC147515 (Accession XM_097243). Accordingly, utilities of VGAM2482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147515. LOC92841 (Accession XM_047583) is another VGAM2482 host target gene. LOC92841 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92841 BINDING SITE, designated SEQ ID:35003, to the nucleotide sequence of VGAM2482 RNA, herein designated VGAM RNA, also designated SEQ ID:5193.

[84068] Another function of VGAM2482 is therefore inhibition of LOC92841 (Accession XM_047583). Accordingly, utilities of VGAM2482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92841. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2483 (VGAM2483) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84069] VGAM2483 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2483 was detected is described hereinabove with reference to Figs. 1-8.

[84070] VGAM2483 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2483 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84071] VGAM2483 gene encodes a VGAM2483 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2483 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2483 precursor RNA is designated SEQ ID:2469, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2469 is located at position 166603 relative to the

genome of Mouse Cytomegalovirus 1.

[84072] VGAM2483 precursor RNA folds onto itself, forming VGAM2483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84073] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2483 folded precursor RNA into VGAM2483 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2483 RNA is designated SEQ ID:5194, and is provided hereinbelow with reference to the sequence listing part.

[84074] VGAM2483 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2483 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2483 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84075] VGAM2483 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2483 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2483 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2483 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2483 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84076] The complementary binding of VGAM2483 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2483 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2483 host target RNA into VGAM2483 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84077] It is appreciated that VGAM2483 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2483 host target genes. The mRNA of each one of this plurality of VGAM2483 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2483 RNA, herein designated VGAM RNA, and which when bound by VGAM2483 RNA causes inhibition of translation of respective one or more VGAM2483 host target proteins.

[84078] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2483 gene, herein designated VGAM GENE, on one or more VGAM2483 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84079] It is yet further appreciated that a function of VGAM2483 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2483

correlate with, and may be deduced from, the identity of the host target genes which VGAM2483 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84080] Nucleotide sequences of the VGAM2483 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2483 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2483 are further described hereinbelow with reference to Table 1.

[84081] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2483 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2483 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84082] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2483 gene, herein designated VGAM is inhibition of expression of VGAM2483 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2483 correlate with, and may be deduced

from, the identity of the target genes which VGAM2483 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84083] BTG Family, Member 2 (BTG2, Accession NM_006763) is a VGAM2483 host target gene. BTG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTG2 BINDING SITE, designated SEQ ID:13628, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84084] A function of VGAM2483 is therefore inhibition of BTG Family, Member 2 (BTG2, Accession NM_006763). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTG2. CDP-diacylglycerol Synthase (phosphatidate cytidylyltransferase) 2 (CDS2, Accession NM_003818) is another VGAM2483 host target gene. CDS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDS2, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDS2 BINDING SITE, designated SEQ ID:9911, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84085] Another function of VGAM2483 is therefore inhibition of CDP-diacylglycerol Synthase (phosphatidate cytidylyltransferase) 2 (CDS2, Accession NM_003818), a gene which is a key regulator of the amount of PIP2 available for signaling. Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDS2. The function of CDS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM900.Fibulin 1 (FBLN1, Accession NM_006485) is another VGAM2483 host target gene. FBLN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBLN1 BINDING SITE, designated SEQ ID:13212, to the nucleotide sequence of

VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84086] Another function of VGAM2483 is therefore inhibition of Fibulin 1 (FBLN1, Accession NM_006485), a gene which secreted glycoprotein; has EGF-like repeats, similar to anaphylatoxins C3a, C4a, and C5a. Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBLN1. The function of FBLN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1770.Glycyl-tRNA Synthetase (GARS, Accession NM_002047) is another VGAM2483 host target gene. GARS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GARS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GARS BINDING SITE, designated SEQ ID:7797, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84087] Another function of VGAM2483 is therefore inhibition of Glycyl-tRNA Synthetase (GARS, Accession NM_002047), a

gene which functions in protein biosynthesis. Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARS. The function of GARS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM113.Glyoxalase I (GLO1, Accession NM_006708) is another VGAM2483 host target gene. GLO1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GLO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLO1 BINDING SITE, designated SEQ ID:13532, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84088] Another function of VGAM2483 is therefore inhibition of Glyoxalase I (GLO1, Accession NM_006708), a gene which converts methylglyoxal and glutathione to S-lactoylglutathione. Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLO1. The function of GLO1 and its association with various diseases and clinical

conditions, has been established by previous studies, as described hereinabove with reference to VGAM786.Matrilin 1, Cartilage Matrix Protein (MATN1, Accession NM_002379) is another VGAM2483 host target gene. MATN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MATN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MATN1 BINDING SITE, designated SEQ ID:8195, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84089] Another function of VGAM2483 is therefore inhibition of Matrilin 1, Cartilage Matrix Protein (MATN1, Accession NM_002379), a gene which a major component of the extracellular matrix of nonarticular cartilage. Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MATN1. The function of MATN1 has been established by previous studies. Cartilage matrix protein is a major component of the extracellular matrix of nonarticular cartilage. Jenkins et al. (1990) used a partial chicken CMP

cDNA probe to isolate 3 overlapping human genomic clones. From one of these clones, a probe containing 2 human CMP exons was isolated and used to map the gene to 1p35 by a combination of Southern blot analysis of somatic cell hybrids and in situ chromosomal hybridization. The genomic probe was also used to screen a human retina cDNA library. The protein sequence predicted by the cDNA clones has 496 amino acids, including a 22-residue signal peptide. The structure of the CMP gene (also symbolized CRTM) and polypeptide were strikingly similar in the chicken and in the human. The human gene spans 12 kb and has 8 exons and 7 introns. By linkage studies, Loughlin et al. (1994) demonstrated that the CRTM gene segregated independently of several heritable chondrodysplasias: hypochondroplasia, achondroplasia, autosomal dominant SED tarda, and multiple epiphyseal dysplasia. CMP was alternatively named matrilin-1 by Deak et al. (1997) when they discovered matrilin-2 (OMIM Ref. No. 602108). Wagener et al. (1997) found that matrilin-1 is a trimer of identical ellipsoid subunits assembled via their C-terminal extension domains in a coiled-coil alpha-helix. The matrilins, including matrilin-2 and matrilin-3 (OMIM Ref. No. 602109), represent a subfamily

of extracellular matrix proteins containing the von Willebrand factor type A (vWFA)-like domain. (The vWFA-like domain was first described in von Willebrand factor (OMIM Ref. No. 193400) where it plays a key role in promoting platelet adhesion to the subendothelin. Several vWFA-like domains have been implicated in interactions with collagen.) In some patients with rheumatoid arthritis (RA; 180300) and relapsing polychondritis (RP), an immune response against cartilage collagen II can be detected. However, study of responses against noncollagenous components of cartilage are limited. If an autoimmune response to cartilage proteins is involved in RA and RP, the different patterns of the affected tissues can best be explained if the respective targets are proteins with specific tissue distributions. Whereas RA preferentially affects diarthrodial joints, RP is characterized by inflammatory attacks on cartilage in different organs, and, preferentially, in the perichondrial layer of cartilage. The inflammatory infiltrates consist of neutrophils, lymphocytes, macrophages, and plasma cells. In early lesions, eosinophils can be observed close to the affected cartilage. A classic appearance of the patient with RP is 'saddle nose,' caused by erosive inflammation of the nasal septum. Another typical symptom is

an inflamed external ear (89% of cases), which in some instances leads to ossified ear cartilages (OMIM Ref. No. 165670). Occasionally, joints are affected as a seronegative nonerosive arthritis. The most serious complication of RP is the involvement of the laryngotracheal cartilage, sometimes leading to lethal breathing difficulties. Early signs of airway involvement are cough, dysphonia, and tenderness over the thyroid cartilage. Remarkably, RP is associated with the same HLA haplotype (DR4) as RA, which carries with it approximately the same relative risk (Zeuner et al., 1997; Lang et al., 1993). To investigate whether the tissue distribution of relapsing polychondritis may be explained by a specific immune response, Hansson et al. (1999) immunized rats with matrilin-1, which is expressed predominantly in tracheal cartilage. After 2 to 3 weeks, some rats developed severe inspiratory stridor. They had swollen noses and/or epistaxis, but showed neither joint nor outer ear affection. The inflammatory lesions involved chronic active erosions of cartilage. Female rats were more susceptible than males. The disease susceptibility was controlled by MHC genes, some haplotypes being high responders and others resistant, and by non-MHC genes as well, as indicated by strain differences (the

LEW strain was susceptible, and the DA strain resistant). All strains mounted a pronounced IgG response to matrilin-1. The findings suggested that different cartilage proteins are involved in pathogenic models of RP and RA.

[84090] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[84091] Jenkins, R. N.; Osborne-Lawrence, S. L.; Sinclair, A. K.; Eddy, R. L., Jr.; Byers, M. G.; Shows, T. B.; Duby, A. D. : Structure and chromosomal location of the human gene encoding cartilage matrix protein. J. Biol. Chem. 265: 19624-19631, 1990. ; and

[84092] Deak, F.; Piecha, D.; Bachrati, C.; Paulsson, M.; Kiss, I. : Primary structure and expression of matrilin-2, the closest relative of cartilage matrix protein within the von Willebrand fa.

[84093] Further studies establishing the function and utilities of MATN1 are found in John Hopkins OMIM database record ID 115437, and in sited publications numbered 12587-12591, 1258 and 12592-12594 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Proteoglycan 1, Secretory Granule (PRG1, Accession NM_002727) is another VGAM2483 host

target gene. PRG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRG1 BINDING SITE, designated SEQ ID:8591, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84094] Another function of VGAM2483 is therefore inhibition of Proteoglycan 1, Secretory Granule (PRG1, Accession NM_002727), a gene which protects cells from apoptosis induced by FAS or TNFA. Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRG1. The function of PRG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2465.Pituitary Tumor-transforming 1 Interacting Protein (PTTG1IP, Accession NM_004339) is another VGAM2483 host target gene. PTTG1IP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTTG1IP, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTTG1IP BINDING SITE, designated SEQ ID:10536, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84095] Another function of VGAM2483 is therefore inhibition of Pituitary Tumor-transforming 1 Interacting Protein (PTTG1IP, Accession NM_004339), a gene which facilitates the translocation of PTTG to the nucleus. Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTTG1IP. The function of PTTG1IP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131.WTAP (Accession NM_004906) is another VGAM2483 host target gene. WTAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WTAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WTAP BINDING SITE, designated SEQ ID:11345, to the nu-

cleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84096] Another function of VGAM2483 is therefore inhibition of WTAP (Accession NM_004906), a gene which plays a role in both transcriptional and posttranscriptional regulation of certain cellular genes. Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WTAP. The function of WTAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM874.Cystatin F (leukocystatin) (CST7, Accession NM_003650) is another VGAM2483 host target gene. CST7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CST7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CST7 BINDING SITE, designated SEQ ID:9726, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84097] Another function of VGAM2483 is therefore inhibition of Cystatin F (leukocystatin) (CST7, Accession NM_003650).

Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CST7. Cytochrome P450, Subfamily IIS, Polypeptide 1 (CYP2S1, Accession NM_030622) is another VGAM2483 host target gene. CYP2S1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP2S1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP2S1 BINDING SITE, designated SEQ ID:24965, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84098] Another function of VGAM2483 is therefore inhibition of Cytochrome P450, Subfamily IIS, Polypeptide 1 (CYP2S1, Accession NM_030622). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP2S1. DKFZP564I0422 (Accession NM_031435) is another VGAM2483 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:25436, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84099] Another function of VGAM2483 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259) is another VGAM2483 host target gene. DOCK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DOCK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK3 BINDING SITE, designated SEQ ID:33037, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84100] Another function of VGAM2483 is therefore inhibition of Dedicator of Cyto-kinesis 3 (DOCK3, Accession

XM_039259). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK3. FLJ11259 (Accession NM_018370) is another VGAM2483 host target gene. FLJ11259 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11259 BINDING SITE, designated SEQ ID:20385, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84101] Another function of VGAM2483 is therefore inhibition of FLJ11259 (Accession NM_018370). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11259. FLJ13197 (Accession NM_024614) is another VGAM2483 host target gene. FLJ13197 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ13197 BINDING SITE, designated SEQ ID:23874, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84102] Another function of VGAM2483 is therefore inhibition of FLJ13197 (Accession NM_024614). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13197. KIAA0226 (Accession XM_032901) is another VGAM2483 host target gene. KIAA0226 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0226 BINDING SITE, designated SEQ ID:31788, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84103] Another function of VGAM2483 is therefore inhibition of KIAA0226 (Accession XM_032901). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0226. KIAA1432 (Accession XM_039698) is another

VGAM2483 host target gene. KIAA1432 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1432 BINDING SITE, designated SEQ ID:33150, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84104] Another function of VGAM2483 is therefore inhibition of KIAA1432 (Accession XM_039698). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1432. KIAA1530 (Accession XM_042661) is another VGAM2483 host target gene. KIAA1530 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1530, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:33736, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84105] Another function of VGAM2483 is therefore inhibition of KIAA1530 (Accession XM_042661). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530. MGC23445 (Accession NM_144606) is another VGAM2483 host target gene. MGC23445 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC23445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC23445 BINDING SITE, designated SEQ ID:29420, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84106] Another function of VGAM2483 is therefore inhibition of MGC23445 (Accession NM_144606). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC23445. Phosphatase, Orphan 1 (phospho1, Accession XM_091572) is another VGAM2483 host target gene. phospho1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by phospho1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of phospho1 BINDING SITE, designated SEQ ID:40064, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84107] Another function of VGAM2483 is therefore inhibition of Phosphatase, Orphan 1 (phospho1, Accession XM_091572). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with phospho1. SARM (Accession NM_015077) is another VGAM2483 host target gene. SARM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SARM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SARM BINDING SITE, designated SEQ ID:17464, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84108] Another function of VGAM2483 is therefore inhibition of SARM (Accession NM_015077). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SARM. SSB-4 (Accession NM_080862) is another VGAM2483 host target gene. SSB-4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSB-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSB-4 BINDING SITE, designated SEQ ID:28106, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84109] Another function of VGAM2483 is therefore inhibition of SSB-4 (Accession NM_080862). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSB-4. LOC145694 (Accession XM_096838) is another VGAM2483 host target gene. LOC145694 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145694 BINDING SITE, designated SEQ ID:40558, to

the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84110] Another function of VGAM2483 is therefore inhibition of LOC145694 (Accession XM_096838). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145694. LOC256158 (Accession XM_175125) is another VGAM2483 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46629, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84111] Another function of VGAM2483 is therefore inhibition of LOC256158 (Accession XM_175125). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. LOC57106 (Accession XM_034377) is another VGAM2483 host target gene. LOC57106 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC57106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57106 BINDING SITE, designated SEQ ID:32074, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84112] Another function of VGAM2483 is therefore inhibition of LOC57106 (Accession XM_034377). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57106. LOC90133 (Accession XM_029323) is another VGAM2483 host target gene. LOC90133 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90133 BINDING SITE, designated SEQ ID:30869, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84113] Another function of VGAM2483 is therefore inhibition of LOC90133 (Accession XM_029323). Accordingly, utilities

of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90133. LOC91689 (Accession NM_033318) is another VGAM2483 host target gene. LOC91689 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91689, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91689 BINDING SITE, designated SEQ ID:27157, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84114] Another function of VGAM2483 is therefore inhibition of LOC91689 (Accession NM_033318). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91689. LOC91974 (Accession XM_041974) is another VGAM2483 host target gene. LOC91974 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91974, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91974 BINDING SITE, designated SEQ ID:33655, to the nucleotide sequence of VGAM2483 RNA, herein designated VGAM RNA, also designated SEQ ID:5194.

[84115] Another function of VGAM2483 is therefore inhibition of LOC91974 (Accession XM_041974). Accordingly, utilities of VGAM2483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91974. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2484 (VGAM2484) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84116] VGAM2484 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2484 was detected is described hereinabove with reference to Figs. 1-8.

[84117] VGAM2484 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2484 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84118] VGAM2484 gene encodes a VGAM2484 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2484 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2484 precursor RNA is designated SEQ ID:2470, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2470 is located at position 183727 relative to the genome of Mouse Cytomegalovirus 1.

[84119] VGAM2484 precursor RNA folds onto itself, forming VGAM2484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84120] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2484 folded precursor RNA into VGAM2484 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2484 RNA is designated SEQ ID:5195, and is provided hereinbelow with reference to the sequence listing part.

[84121] VGAM2484 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2484 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2484 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84122] VGAM2484 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2484 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2484 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2484 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2484 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84123] The complementary binding of VGAM2484 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2484 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2484 host target RNA into VGAM2484 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84124] It is appreciated that VGAM2484 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2484 host target genes. The mRNA of each one of this plurality of VGAM2484 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2484 RNA, herein designated VGAM RNA, and which when bound by VGAM2484 RNA causes inhibition of translation of respective one or more VGAM2484 host target proteins.

[84125] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2484 gene, herein designated VGAM GENE, on one or more VGAM2484 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84126] It is yet further appreciated that a function of VGAM2484 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2484 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2484 correlate with, and may be deduced from, the identity of the host target genes which VGAM2484 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84127] Nucleotide sequences of the VGAM2484 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2484 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2484 are further described hereinbelow with reference to Table 1.

[84128] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2484 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2484 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84129] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2484 gene, herein designated VGAM is inhibition of expression of VGAM2484 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2484 correlate with, and may be deduced from, the identity of the target genes which VGAM2484 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84130] FLJ10565 (Accession NM_018140) is a VGAM2484 host target gene. FLJ10565 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10565 BINDING SITE, designated SEQ ID:19938, to the nucleotide sequence of VGAM2484 RNA, herein designated VGAM RNA, also designated SEQ ID:5195.

[84131] A function of VGAM2484 is therefore inhibition of

FLJ10565 (Accession NM_018140). Accordingly, utilities of VGAM2484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10565. Neurexophilin 3 (NXPH3, Accession XM_037847) is another VGAM2484 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32712, to the nucleotide sequence of VGAM2484 RNA, herein designated VGAM RNA, also designated SEQ ID:5195.

[84132] Another function of VGAM2484 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM_037847). Accordingly, utilities of VGAM2484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2485 (VGAM2485) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[84133] VGAM2485 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2485 was detected is described hereinabove with reference to Figs. 1-8.

[84134] VGAM2485 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2485 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84135] VGAM2485 gene encodes a VGAM2485 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2485 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2485 precursor RNA is designated SEQ ID:2471, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2471 is located at position 214191 relative to the genome of Mouse Cytomegalovirus 1.

[84136] VGAM2485 precursor RNA folds onto itself, forming VGAM2485 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84137] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2485 folded precursor RNA into VGAM2485 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2485 RNA is designated SEQ ID:5196, and is provided hereinbelow with reference to the sequence listing part.

[84138] VGAM2485 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2485 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2485 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84139] VGAM2485 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2485 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2485 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2485 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2485 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84140] The complementary binding of VGAM2485 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2485 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2485 host target RNA into VGAM2485 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84141] It is appreciated that VGAM2485 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2485 host target genes. The mRNA of each one of this plurality of VGAM2485 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2485 RNA, herein designated VGAM RNA, and which when bound by VGAM2485 RNA causes inhibition of translation of respective one or more VGAM2485 host target proteins.

[84142] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2485 gene, herein designated VGAM GENE, on one or more VGAM2485 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84143] It is yet further appreciated that a function of VGAM2485 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2485 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2485 correlate with, and may be deduced from, the identity of the host target genes which VGAM2485 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[84144] Nucleotide sequences of the VGAM2485 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2485 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2485 are further described hereinbelow with reference to Table 1.

[84145] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2485 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2485 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84146] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2485 gene, herein designated VGAM is inhibition of expression of VGAM2485 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2485 correlate with, and may be deduced from, the identity of the target genes which VGAM2485 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84147] Rho GDP Dissociation Inhibitor (GDI) Alpha (ARHGDIA, Accession NM_004309) is a VGAM2485 host target gene. ARHGDIA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHGDIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGDIA BINDING SITE, designated SEQ ID:10513, to the nucleotide sequence of VGAM2485 RNA, herein designated VGAM RNA, also designated SEQ ID:5196.

[84148] A function of VGAM2485 is therefore inhibition of Rho GDP Dissociation Inhibitor (GDI) Alpha (ARHGDIA, Accession NM_004309), a gene which is a small guanine nucleotide exchange (GTP/GDP) factor. Accordingly, utilities of VGAM2485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGDIA. The function of ARHGDIA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM435.Solute Carrier Family 20 (phosphate transporter), Member 2 (SLC20A2, Accession NM_006749) is another VGAM2485 host target gene.

SLC20A2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC20A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC20A2 BINDING SITE, designated SEQ ID:13600, to the nucleotide sequence of VGAM2485 RNA, herein designated VGAM RNA, also designated SEQ ID:5196.

[84149] Another function of VGAM2485 is therefore inhibition of Solute Carrier Family 20 (phosphate transporter), Member 2 (SLC20A2, Accession NM_006749), a gene which is a sodium-phosphate symporter. Accordingly, utilities of VGAM2485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC20A2. The function of SLC20A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232.Chemokine (C-C motif) Receptor 5 (CCR5, Accession NM_000579) is another VGAM2485 host target gene. CCR5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCR5, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR5 BINDING SITE, designated SEQ ID:6185, to the nucleotide sequence of VGAM2485 RNA, herein designated VGAM RNA, also designated SEQ ID:5196.

[84150] Another function of VGAM2485 is therefore inhibition of Chemokine (C-C motif) Receptor 5 (CCR5, Accession NM_000579). Accordingly, utilities of VGAM2485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR5. FLJ10826 (Accession NM_018233) is another VGAM2485 host target gene. FLJ10826 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10826 BINDING SITE, designated SEQ ID:20175, to the nucleotide sequence of VGAM2485 RNA, herein designated VGAM RNA, also designated SEQ ID:5196.

[84151] Another function of VGAM2485 is therefore inhibition of FLJ10826 (Accession NM_018233). Accordingly, utilities of

VGAM2485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10826. LOC142941 (Accession XM_096363) is another VGAM2485 host target gene. LOC142941 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC142941, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142941 BINDING SITE, designated SEQ ID:40324, to the nucleotide sequence of VGAM2485 RNA, herein designated VGAM RNA, also designated SEQ ID:5196.

[84152] Another function of VGAM2485 is therefore inhibition of LOC142941 (Accession XM_096363). Accordingly, utilities of VGAM2485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142941. LOC150279 (Accession XM_086820) is another VGAM2485 host target gene. LOC150279 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150279 BINDING SITE, designated SEQ ID:38901, to the nucleotide sequence of VGAM2485 RNA, herein designated VGAM RNA, also designated SEQ ID:5196.

[84153] Another function of VGAM2485 is therefore inhibition of LOC150279 (Accession XM_086820). Accordingly, utilities of VGAM2485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150279. LOC152992 (Accession XM_087575) is another VGAM2485 host target gene. LOC152992 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152992 BINDING SITE, designated SEQ ID:39347, to the nucleotide sequence of VGAM2485 RNA, herein designated VGAM RNA, also designated SEQ ID:5196.

[84154] Another function of VGAM2485 is therefore inhibition of LOC152992 (Accession XM_087575). Accordingly, utilities of VGAM2485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152992. LOC158863 (Accession XM_098999) is another VGAM2485 host target gene. LOC158863 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158863, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158863 BINDING SITE, designated SEQ ID:42036, to the nucleotide sequence of VGAM2485 RNA, herein designated VGAM RNA, also designated SEQ ID:5196.

[84155] Another function of VGAM2485 is therefore inhibition of LOC158863 (Accession XM_098999). Accordingly, utilities of VGAM2485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158863. LOC221954 (Accession XM_168349) is another VGAM2485 host target gene. LOC221954 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221954 BINDING SITE, designated SEQ ID:45121, to the nucleotide sequence of VGAM2485 RNA, herein designated VGAM RNA, also designated SEQ ID:5196.

[84156] Another function of VGAM2485 is therefore inhibition of

LOC221954 (Accession XM_168349). Accordingly, utilities of VGAM2485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221954. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2486 (VGAM2486) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84157] VGAM2486 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2486 was detected is described hereinabove with reference to Figs. 1-8.

[84158] VGAM2486 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2486 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84159] VGAM2486 gene encodes a VGAM2486 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2486 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2486 precursor RNA is designated SEQ ID:2472, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2472 is located at position 54581 relative to the genome of Mouse Cytomegalovirus 1.

[84160] VGAM2486 precursor RNA folds onto itself, forming VGAM2486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84161] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2486 folded precursor RNA into VGAM2486 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM2486 RNA is designated SEQ ID:5197, and is provided hereinbelow with reference to the sequence listing part.

[84162] VGAM2486 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2486 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2486 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84163] VGAM2486 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2486 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2486 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2486 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2486 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84164] The complementary binding of VGAM2486 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2486 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2486 host target RNA into VGAM2486 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84165] It is appreciated that VGAM2486 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2486 host target genes. The mRNA of each one of this plurality of VGAM2486 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2486 RNA, herein designated VGAM RNA, and which when bound by VGAM2486 RNA causes inhibition of translation of respective one or more VGAM2486 host target proteins.

[84166] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2486 gene, herein designated VGAM GENE, on one or more VGAM2486 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84167] It is yet further appreciated that a function of VGAM2486

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2486 correlate with, and may be deduced from, the identity of the host target genes which VGAM2486 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84168] Nucleotide sequences of the VGAM2486 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2486 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2486 are further described hereinbelow with reference to Table 1.

[84169] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2486 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2486 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84170] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2486 gene, herein designated VGAM is inhibition of expression of VGAM2486 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2486 correlate with, and may be deduced from, the identity of the target genes which VGAM2486 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84171] Cytoplasmic Linker 2 (CYLN2, Accession NM_003388) is a VGAM2486 host target gene. CYLN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYLN2 BINDING SITE, designated SEQ ID:9420, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84172] A function of VGAM2486 is therefore inhibition of Cytoplasmic Linker 2 (CYLN2, Accession NM_003388), a gene which associates with microtubules and dendritic lamellar bodies. Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with CYLN2. The function of CYLN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM94.Galanin Receptor 1 (GALR1, Accession NM_001480) is another VGAM2486 host target gene. GALR1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GALR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALR1 BINDING SITE, designated SEQ ID:7216, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84173] Another function of VGAM2486 is therefore inhibition of Galanin Receptor 1 (GALR1, Accession NM_001480), a gene which plays a role in regulating ion transport. Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALR1. The function of GALR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1245.Heparanase (HPSE,

Accession NM_006665) is another VGAM2486 host target gene. HPSE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HPSE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPSE BINDING SITE, designated SEQ ID:13477, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84174] Another function of VGAM2486 is therefore inhibition of Heparanase (HPSE, Accession NM_006665), a gene which is an endoglycosidase that cleaves heparan sulfate. Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPSE. The function of HPSE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM374.Interleukin 17 Receptor (IL17R, Accession NM_014339) is another VGAM2486 host target gene. IL17R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL17R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL17R BINDING SITE, designated SEQ ID:15660, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84175] Another function of VGAM2486 is therefore inhibition of Interleukin 17 Receptor (IL17R, Accession NM_014339). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL17R. 2'-5'-oligoadenylate Synthetase 3, 100kDa (OAS3, Accession NM_006187) is another VGAM2486 host target gene. OAS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAS3 BINDING SITE, designated SEQ ID:12862, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84176] Another function of VGAM2486 is therefore inhibition of 2'-5'-oligoadenylate Synthetase 3, 100kDa (OAS3, Accession NM_006187), a gene which may play a role in medi-

ating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAS3. The function of OAS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309.Protocadherin 11 X-linked (PCDH11X, Accession NM_032967) is another VGAM2486 host target gene. PCDH11X BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDH11X, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE, designated SEQ ID:26781, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84177] Another function of VGAM2486 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM_032967), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous

system. Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.Protocadherin 11 Y-linked (PCDH11Y, Accession NM_032971) is another VGAM2486 host target gene. PCDH11Y BINDING SITE1 and PCDH11Y BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11Y, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11Y BINDING SITE1 and PCDH11Y BINDING SITE2, designated SEQ ID:26814 and SEQ ID:26816 respectively, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84178] Another function of VGAM2486 is therefore inhibition of Protocadherin 11 Y-linked (PCDH11Y, Accession NM_032971). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11Y. Solute Carrier

Family 2 (facilitated glucose transporter), Member 6 (SLC2A6, Accession NM_017585) is another VGAM2486 host target gene. SLC2A6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC2A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A6 BINDING SITE, designated SEQ ID:19031, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84179] Another function of VGAM2486 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 6 (SLC2A6, Accession NM_017585). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A6. SMG1 (Accession NM_015092) is another VGAM2486 host target gene. SMG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMG1 BINDING SITE,

designated SEQ ID:17480, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84180] Another function of VGAM2486 is therefore inhibition of SMG1 (Accession NM_015092), a gene which acts as the target for the cell-cycle arrest and immunosuppressive effects. Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMG1. The function of SMG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419.Surfeit 5 (SURF5, Accession NM_006752) is another VGAM2486 host target gene. SURF5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SURF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURF5 BINDING SITE, designated SEQ ID:13604, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84181] Another function of VGAM2486 is therefore inhibition of

Surfeit 5 (SURF5, Accession NM_006752). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURF5. Rho Guanine Nucleotide Exchange Factor (GEF) 15 (ARHGEF15, Accession NM_014958) is another VGAM2486 host target gene. ARHGEF15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHGEF15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF15 BINDING SITE, designated SEQ ID:17318, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84182] Another function of VGAM2486 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 15 (ARHGEF15, Accession NM_014958). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF15. Fidgetin (FIGN, Accession XM_171005) is another VGAM2486 host target gene. FIGN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FIGN, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FIGN BINDING SITE, designated SEQ ID:45774, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84183] Another function of VGAM2486 is therefore inhibition of Fidgetin (FIGN, Accession XM_171005). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FIGN. FLJ10738 (Accession NM_018199) is another VGAM2486 host target gene. FLJ10738 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10738 BINDING SITE, designated SEQ ID:20070, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84184] Another function of VGAM2486 is therefore inhibition of FLJ10738 (Accession NM_018199). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10738. FLJ12443 (Accession NM_024830) is another VGAM2486 host target gene. FLJ12443 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12443 BINDING SITE, designated SEQ ID:24222, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84185] Another function of VGAM2486 is therefore inhibition of FLJ12443 (Accession NM_024830). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12443. FLJ12684 (Accession NM_024534) is another VGAM2486 host target gene. FLJ12684 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12684, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12684 BINDING SITE, designated SEQ ID:23745, to the nucleotide

sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84186] Another function of VGAM2486 is therefore inhibition of FLJ12684 (Accession NM_024534). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12684. FLJ20139 (Accession NM_017685) is another VGAM2486 host target gene. FLJ20139 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20139 BINDING SITE, designated SEQ ID:19238, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84187] Another function of VGAM2486 is therefore inhibition of FLJ20139 (Accession NM_017685). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20139. FLJ23042 (Accession NM_025157) is another VGAM2486 host target gene. FLJ23042 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ23042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23042 BINDING SITE, designated SEQ ID:24796, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84188] Another function of VGAM2486 is therefore inhibition of FLJ23042 (Accession NM_025157). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23042. FLJ23403 (Accession NM_022068) is another VGAM2486 host target gene. FLJ23403 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23403, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23403 BINDING SITE, designated SEQ ID:22612, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84189] Another function of VGAM2486 is therefore inhibition of FLJ23403 (Accession NM_022068). Accordingly, utilities of

VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23403. G2 (Accession XM_039515) is another VGAM2486 host target gene. G2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G2 BINDING SITE, designated SEQ ID:33110, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84190] Another function of VGAM2486 is therefore inhibition of G2 (Accession XM_039515). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G2. HOMER-2B (Accession NM_004839) is another VGAM2486 host target gene. HOMER-2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOMER-2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOMER-2B BINDING

SITE, designated SEQ ID:11248, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84191] Another function of VGAM2486 is therefore inhibition of HOMER-2B (Accession NM_004839). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOMER-2B. KIAA0889 (Accession NM_015377) is another VGAM2486 host target gene. KIAA0889 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:17678, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84192] Another function of VGAM2486 is therefore inhibition of KIAA0889 (Accession NM_015377). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0889. KIAA1786 (Accession XM_038436) is another VGAM2486 host target gene. KIAA1786 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1786 BINDING SITE, designated SEQ ID:32845, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84193] Another function of VGAM2486 is therefore inhibition of KIAA1786 (Accession XM_038436). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1786. Testis-specific Transcript, Y-linked 2 (TTTY2, Accession XM_099029) is another VGAM2486 host target gene. TTTY2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TTTY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTTY2 BINDING SITE, designated SEQ ID:42068, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84194] Another function of VGAM2486 is therefore inhibition of Testis-specific Transcript, Y-linked 2 (TTTY2, Accession XM_099029). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTTY2. Zinc Finger Protein 384 (ZNF384, Accession NM_133476) is another VGAM2486 host target gene. ZNF384 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF384, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF384 BINDING SITE, designated SEQ ID:28543, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84195] Another function of VGAM2486 is therefore inhibition of Zinc Finger Protein 384 (ZNF384, Accession NM_133476). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF384. LOC126917 (Accession XM_059091) is another VGAM2486 host target gene. LOC126917 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

LOC126917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126917 BINDING SITE, designated SEQ ID:36873, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84196] Another function of VGAM2486 is therefore inhibition of LOC126917 (Accession XM_059091). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126917. LOC145945 (Accession XM_096908) is another VGAM2486 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40628, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84197] Another function of VGAM2486 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities

of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC149320 (Accession XM_047557) is another VGAM2486 host target gene. LOC149320 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149320 BINDING SITE, designated SEQ ID:35001, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84198] Another function of VGAM2486 is therefore inhibition of LOC149320 (Accession XM_047557). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149320. LOC152926 (Accession XM_087562) is another VGAM2486 host target gene. LOC152926 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC152926 BINDING SITE, designated SEQ ID:39339, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84199] Another function of VGAM2486 is therefore inhibition of LOC152926 (Accession XM_087562). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152926. LOC159148 (Accession XM_099030) is another VGAM2486 host target gene. LOC159148 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159148, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159148 BINDING SITE, designated SEQ ID:42075, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84200] Another function of VGAM2486 is therefore inhibition of LOC159148 (Accession XM_099030). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159148. LOC255196 (Accession XM_173157) is another VGAM2486 host target gene. LOC255196 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255196 BINDING SITE, designated SEQ ID:46412, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84201] Another function of VGAM2486 is therefore inhibition of LOC255196 (Accession XM_173157). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255196. LOC93613 (Accession XM_052568) is another VGAM2486 host target gene. LOC93613 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93613 BINDING SITE, designated SEQ ID:35997, to the nucleotide sequence of VGAM2486 RNA, herein designated VGAM RNA, also designated SEQ ID:5197.

[84202] Another function of VGAM2486 is therefore inhibition of

LOC93613 (Accession XM_052568). Accordingly, utilities of VGAM2486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93613. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2487 (VGAM2487) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84203] VGAM2487 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2487 was detected is described hereinabove with reference to Figs. 1-8.

[84204] VGAM2487 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2487 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84205] VGAM2487 gene encodes a VGAM2487 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2487 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2487 precursor RNA is designated SEQ ID:2473, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2473 is located at position 105519 relative to the genome of Mouse Cytomegalovirus 1.

[84206] VGAM2487 precursor RNA folds onto itself, forming VGAM2487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84207] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2487 folded precursor RNA into VGAM2487 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM2487 RNA is designated SEQ ID:5198, and is provided hereinbelow with reference to the sequence listing part.

[84208] VGAM2487 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2487 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2487 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84209] VGAM2487 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2487 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2487 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2487 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2487 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84210] The complementary binding of VGAM2487 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2487 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2487 host target RNA into VGAM2487 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84211] It is appreciated that VGAM2487 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2487 host target genes. The mRNA of each one of this plurality of VGAM2487 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2487 RNA, herein designated VGAM RNA, and which when bound by VGAM2487 RNA causes inhibition of translation of respective one or more VGAM2487 host target proteins.

[84212] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2487 gene, herein designated VGAM GENE, on one or more VGAM2487 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84213] It is yet further appreciated that a function of VGAM2487

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2487 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2487 correlate with, and may be deduced from, the identity of the host target genes which VGAM2487 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84214] Nucleotide sequences of the VGAM2487 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2487 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2487 are further described hereinbelow with reference to Table 1.

[84215] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2487 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2487 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84216] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2487 gene, herein designated VGAM is inhibition of expression of VGAM2487 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2487 correlate with, and may be deduced from, the identity of the target genes which VGAM2487 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84217] Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM_022041) is a VGAM2487 host target gene. GAN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAN BINDING SITE, designated SEQ ID:22564, to the nucleotide sequence of VGAM2487 RNA, herein designated VGAM RNA, also designated SEQ ID:5198.

[84218] A function of VGAM2487 is therefore inhibition of Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM_022041), a gene which plays an important role in neurofilament architecture. Accordingly, utilities of VGAM2487 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with GAN. The function of GAN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM606.FLJ20174 (Accession NM_017699) is another VGAM2487 host target gene. FLJ20174 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20174 BINDING SITE, designated SEQ ID:19269, to the nucleotide sequence of VGAM2487 RNA, herein designated VGAM RNA, also designated SEQ ID:5198.

[84219] Another function of VGAM2487 is therefore inhibition of FLJ20174 (Accession NM_017699). Accordingly, utilities of VGAM2487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20174. KIAA0286 (Accession XM_043118) is another VGAM2487 host target gene. KIAA0286 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0286, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0286 BINDING SITE, designated SEQ ID:33902, to the nucleotide sequence of VGAM2487 RNA, herein designated VGAM RNA, also designated SEQ ID:5198.

[84220] Another function of VGAM2487 is therefore inhibition of KIAA0286 (Accession XM_043118). Accordingly, utilities of VGAM2487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0286. KIAA0930 (Accession XM_047214) is another VGAM2487 host target gene. KIAA0930 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0930 BINDING SITE, designated SEQ ID:34911, to the nucleotide sequence of VGAM2487 RNA, herein designated VGAM RNA, also designated SEQ ID:5198.

[84221] Another function of VGAM2487 is therefore inhibition of KIAA0930 (Accession XM_047214). Accordingly, utilities of VGAM2487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0930. Myosin 5C (MYO5C, Accession NM_018728) is another VGAM2487 host target gene. MYO5C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYO5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO5C BINDING SITE, designated SEQ ID:20817, to the nucleotide sequence of VGAM2487 RNA, herein designated VGAM RNA, also designated SEQ ID:5198.

[84222] Another function of VGAM2487 is therefore inhibition of Myosin 5C (MYO5C, Accession NM_018728). Accordingly, utilities of VGAM2487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO5C. LOC144600 (Accession XM_096639) is another VGAM2487 host target gene. LOC144600 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144600 BINDING SITE, designated SEQ ID:40445, to the nucleotide sequence of VGAM2487 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5198.

[84223] Another function of VGAM2487 is therefore inhibition of LOC144600 (Accession XM_096639). Accordingly, utilities of VGAM2487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144600. LOC90768 (Accession XM_033986) is another VGAM2487 host target gene. LOC90768 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90768 BINDING SITE, designated SEQ ID:31987, to the nucleotide sequence of VGAM2487 RNA, herein designated VGAM RNA, also designated SEQ ID:5198.

[84224] Another function of VGAM2487 is therefore inhibition of LOC90768 (Accession XM_033986). Accordingly, utilities of VGAM2487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90768. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2488 (VGAM2488) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84225] VGAM2488 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2488 was detected is described hereinabove with reference to Figs. 1-8.

[84226] VGAM2488 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2488 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84227] VGAM2488 gene encodes a VGAM2488 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2488 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2488 precursor RNA is designated SEQ ID:2474, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2474 is located at position 77638 relative to the genome of Mouse Cytomegalovirus 1.

[84228] VGAM2488 precursor RNA folds onto itself, forming

VGAM2488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84229] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2488 folded precursor RNA into VGAM2488 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2488 RNA is designated SEQ ID:5199, and is provided hereinbelow with reference to the sequence listing part.

[84230] VGAM2488 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2488 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2488 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84231] VGAM2488 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2488 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2488 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2488 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2488 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84232] The complementary binding of VGAM2488 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2488 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2488 host target RNA into VGAM2488 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84233] It is appreciated that VGAM2488 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2488 host target genes. The mRNA of each one of this plurality of VGAM2488 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2488 RNA, herein designated VGAM RNA, and which when bound by VGAM2488 RNA causes inhibition of translation of respective one or more VGAM2488 host target proteins.

[84234] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2488 gene, herein designated VGAM GENE, on one or more VGAM2488 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84235] It is yet further appreciated that a function of VGAM2488 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2488 correlate with, and may be deduced from, the identity of the host target genes which VGAM2488 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[84236] Nucleotide sequences of the VGAM2488 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2488 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2488 are further described hereinbelow with reference to Table 1.

[84237] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2488 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2488 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84238] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2488 gene, herein designated VGAM is inhibition of expression of VGAM2488 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2488 correlate with, and may be deduced from, the identity of the target genes which VGAM2488 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[84239] ATP-binding Cassette, Sub-family B (MDR/TAP), Member 1 (ABCB1, Accession NM_000927) is a VGAM2488 host target gene. ABCB1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ABCB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCB1 BINDING SITE, designated SEQ ID:6637, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84240] A function of VGAM2488 is therefore inhibition of ATP-binding Cassette, Sub-family B (MDR/TAP), Member 1 (ABCB1, Accession NM_000927), a gene which energy-dependent efflux pump responsible for decreased drug accumulation in multidrug-resistant cells. Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCB1. The function of ABCB1 has been established by previous studies. MDR1 encodes a large transmembrane protein that is an integral part of the blood-brain barrier and functions as a drug-transport pump trans-

porting a variety of drugs from the brain back into the blood. The development of simultaneous resistance to multiple structurally unrelated drugs is a major impediment to cancer chemotherapy. Shen et al. (1986) showed that multidrug resistance in human KB carcinoma cells selected in colchicine, vinblastine, or Adriamycin is associated with amplification of specific DNA sequences termed the multidrug resistance locus (MDR1). Increased expression and amplification of MDR1 sequences were also found in multidrug-resistant sublines of human leukemia and ovarian carcinoma cells. Overexpression of P-glycoprotein-1 appears to be a consistent feature of mammalian cells displaying resistance to multiple anticancer drugs and has been postulated to mediate resistance (Kartner et al., 1985; Riordan et al., 1985). Roninson et al. (1986) found that multidrug resistance correlated with amplification of 2 related DNA sequences, designated MDR1 and MDR2 (MDR2 OMIM Ref. No. 171060). These sequences were isolated through their homology with the Chinese hamster mdr gene. MDR1 encodes a 4.5-kb mRNA and was amplified or overexpressed in all multidrug-resistant human cell lines analyzed. No mRNA corresponding to MDR2 was detected. MDR2 DNA sequences

are coamplified with MDR1 in some but not all multidrug-resistant cell lines. Some specific subgroups of mice and dogs are exquisitely sensitive to the neurologic actions of ivermectin. Studying a subpopulation of collie dogs, Mealey et al. (2001) found that a deletion mutation of the MDR1 gene is associated with ivermectin sensitivity. The 4-bp deletion resulted in a frameshift, generating several stop codons that prematurely terminate the P-glycoprotein gene product. The homozygous normal or heterozygous animals did not display increased sensitivity. Animal model experiments lend further support to the function of ABCB1. Schinkel et al. (1994) generated mice homozygous for a disruption of the mdr1a gene. The mice were viable and fertile and appeared phenotypically normal, but they displayed an increased sensitivity to the centrally neurotoxic pesticide ivermectin (100-fold) and to the carcinostatic drug vinblastine (OMIM Ref. No. 3-fold). By comparison of the homozygous null mice with wildtype mice, they found that the mdr1a P-glycoprotein is the major P-glycoprotein in the blood-brain barrier and that its absence results in elevated drug levels in many tissues, especially in brain, and in decreased drug elimination.

[84241] It is appreciated that the abovementioned animal model

for ABCB1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[84242] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[84243] Mealey, K. L.; Bentjen, S. A.; Gay, J. M.; Cantor, G. H. : Ivermectin sensitivity in collies is associated with a deletion mutation of the mdr1 gene. Pharmacogenetics 11: 727-733, 2001. ; and

[84244] Shen, D.-W.; Fojo, A.; Chin, J. E.; Roninson, I. B.; Richert, N.; Pastan, I.; Gottesman, M. M. : Human multidrug-resistant cell lines: increased mdr1 expression can precede gene amplif.

[84245] Further studies establishing the function and utilities of ABCB1 are found in John Hopkins OMIM database record ID 171050, and in sited publications numbered 11172-11181, 10830-10831, 2291-2292, 383 and 3865-3892 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.ACN (Accession NM_014977) is another VGAM2488 host target gene. ACN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

ACN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACN BINDING SITE, designated SEQ ID:17362, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84246] Another function of VGAM2488 is therefore inhibition of ACN (Accession NM_014977), a gene which is essential for apoptotic chromatin condensation in vitro. Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACN. The function of ACN has been established by previous studies. Apoptosis is defined by several unique morphologic nuclear changes, including chromatin condensation and nuclear fragmentation. These changes are triggered by the activation of a family of cysteine proteases called caspases (see OMIM Ref. No. 147678), and caspase-activated DNase (CAD/DFF40; 601883) and lamin protease (see OMIM Ref. No. 150330) have been implicated in some of these changes. CAD/DFF40 induces chromatin condensation in purified nuclei, but distinct caspase-activated factor(s) may be responsible for chromatin condensation. Sahara et al. (1999) used an in vitro

system to purify a nuclear factor which induces apoptotic chromatin condensation after cleavage by caspase-3 (OMIM Ref. No. 600636) without inducing DNA fragmentation from bovine thymus lysate. The name of the factor, 'acinus,' is both an acronym for 'apoptotic chromatin condensation inducer in the nucleus' and the Latin word for 'grape' or 'berry,' denotive of the grape-like appearance of the condensed chromatin. Immunodepletion experiments showed that acinus is essential for apoptotic chromatin condensation in vitro, and an antisense study revealed that acinus is also important in the induction of apoptotic chromatin condensation in cells. Ishikawa et al. (1998) found that KIAA0670 is ubiquitously expressed. Using the KIAA0670 clone, Sahara et al. (1999) obtained 3 isoforms of human acinus cDNA, the L, S, and S-prime forms, which they stated had probably been generated by alternative splicing.

[84247] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[84248] Ishikawa, K.; Nagase, T.; Suyama, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of coding sequences of unidentified human genes. X. The

complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 5: 169-176, 1998. ; and

[84249] Sahara, S.; Aoto, M.; Eguchi, Y.; Imamoto, N.; Yoneda, Y.; Tsujimoto, Y. : Acinus is a caspase-3-activated protein required for apoptotic chromatin condensation. Nature 401: 168-173, 19.

[84250] Further studies establishing the function and utilities of ACN are found in John Hopkins OMIM database record ID 604562, and in sited publications numbered 8473 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_006125) is another VGAM2488 host target gene. ARHGAP6 BINDING SITE1 and ARHGAP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ARHGAP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE1 and ARHGAP6 BINDING SITE2, designated SEQ ID:12767 and SEQ ID:6845 respectively, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ

ID:5199.

[84251] Another function of VGAM2488 is therefore inhibition of Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_006125), a gene which activates the rho-type GT-Pases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Dachshund Homolog (Drosophila) (DACH, Accession NM_080759) is another VGAM2488 host target gene. DACH BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DACH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DACH BINDING SITE, designated SEQ ID:28039, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84252] Another function of VGAM2488 is therefore inhibition of Dachshund Homolog (Drosophila) (DACH, Accession

NM_080759), a gene which regulates early progenitor cell proliferation during retinogenesis and pituitary development . Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DACH. The function of DACH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM260.Deleted In Liver Cancer 1 (DLC1, Accession NM_006094) is another VGAM2488 host target gene. DLC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DLC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLC1 BINDING SITE, designated SEQ ID:12743, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84253] Another function of VGAM2488 is therefore inhibition of Deleted In Liver Cancer 1 (DLC1, Accession NM_006094), a gene which is a candidate tumor suppressor gene for human cancer. Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with DLC1. The function of DLC1 has been established by previous studies. To identify genes involved in hepatocellular carcinoma (HCC; 114550), Yuan et al. (1998) applied representational difference analysis (RDA), a PCR-based subtractive hybridization technique, to DNA derived from a primary HCC and adjacent noncancerous tissue from the same patient. They identified the novel gene DLC1 as a fragment that was deleted in the primary tumor. Seven of 16 primary HCCs and 10 of 11 HCC cell lines showed loss of heterozygosity (LOH) for the DLC1 gene. Northern blot analysis detected a major 7.5- and a minor 4.5-kb DLC1 transcript in all human tissues examined, including liver, but did not find DLC1 expression in 4 of 14 HCC cell lines. The authors isolated a full-length DLC1 cDNA encoding a deduced 1,091-amino acid protein. The DLC1 gene shares high sequence similarity with the rat p122 RhoGap gene (see OMIM Ref. No. 602680). By FISH, Yuan et al. (1998) mapped the DLC1 gene to 8p22-p21.3, a region frequently deleted in solid tumors. The authors suggested that DLC1 is a candidate tumor suppressor gene for human liver cancer, as well as for prostate, lung, colorectal, and breast cancers. Wilson et al. (2000) delineated the

structure of the DLC1 gene and used SSCP analysis to look for sequence variants in 126 colorectal and 33 ovarian primary tumors and cell lines. One exonic missense mutation and 3 intronic insertions/deletions were identified in primary colorectal tumors, as well as many polymorphisms present in germline DNAs. The rarity of exonic missense mutations, and the absence of protein-truncating mutations, indicated that DLC1 is not the target of the LOH frequently observed on 8p in colorectal and ovarian tumors. The delineation of gene structure allows mutation analysis of DLC1 in other tumor types for which it remains a candidate tumor suppressor gene based on its location and homology to RHOGAP (OMIM Ref. No. 602732).

[84254] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[84255] Wilson, P. J.; McGlinn, E.; Marsh, A.; Evans, T.; Arnold, J.; Wright, K.; Biden, K.; Young, J.; Wainwright, B.; Wicking, C.; Chenevix-Trench, G. : Sequence variants of DLC1 in colorectal and ovarian tumours. Hum. Mutat. 15: 156-165, 2000. ; and

[84256] Yuan, B.-Z.; Miller, M. J.; Keck, C. L.; Zimonjic, D. B.;

Thorgeirsson, S. S.; Popescu, N. C. : Cloning, characterization, and chromosomal localization of a gene frequently deleted in.

[84257] Further studies establishing the function and utilities of DLC1 are found in John Hopkins OMIM database record ID 604258, and in sited publications numbered 7069-7071 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Mutated In Colorectal Cancers (MCC, Accession NM_002387) is another VGAM2488 host target gene. MCC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MCC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCC BINDING SITE, designated SEQ ID:8203, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84258] Another function of VGAM2488 is therefore inhibition of Mutated In Colorectal Cancers (MCC, Accession NM_002387). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCC. Phosphoglycerate

Mutase 1 (brain) (PGAM1, Accession XM_083842) is another VGAM2488 host target gene. PGAM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PGAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGAM1 BINDING SITE, designated SEQ ID:37518, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84259] Another function of VGAM2488 is therefore inhibition of Phosphoglycerate Mutase 1 (brain) (PGAM1, Accession XM_083842). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGAM1. Phospholipase A2, Group X (PLA2G10, Accession NM_003561) is another VGAM2488 host target gene. PLA2G10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PLA2G10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G10 BINDING SITE, designated SEQ ID:9618, to the nucleotide

sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84260] Another function of VGAM2488 is therefore inhibition of Phospholipase A2, Group X (PLA2G10, Accession NM_003561). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G10. Pleckstrin and Sec7 Domain Protein (PSD, Accession NM_002779) is another VGAM2488 host target gene. PSD BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PSD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSD BINDING SITE, designated SEQ ID:8666, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84261] Another function of VGAM2488 is therefore inhibition of Pleckstrin and Sec7 Domain Protein (PSD, Accession NM_002779), a gene which promotes guanine-nucleotide exchange on arf6. Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSD. The function of

PSD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM261.SRY (sex determining region Y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NM_000346) is another VGAM2488 host target gene. SOX9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SOX9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX9 BINDING SITE, designated SEQ ID:5898, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84262] Another function of VGAM2488 is therefore inhibition of SRY (sex determining region Y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NM_000346), a gene which regulates the expression of other genes involved in chondrogenesis. Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX9. The function of SOX9 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM329.Thromboxane A2 Receptor (TBXA2R, Accession NM_001060) is another VGAM2488 host target gene. TBXA2R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBXA2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBXA2R BINDING SITE, designated SEQ ID:6724, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84263] Another function of VGAM2488 is therefore inhibition of Thromboxane A2 Receptor (TBXA2R, Accession NM_001060), a gene which activates Ca2+-activated chloride channels; stimulates platelet aggregation and smooth muscle constriction. Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBXA2R. The function of TBXA2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.Transcription Factor 1, Hepatic;

LF-B1, Hepatic Nuclear Factor (HNF1), Albumin Proximal Factor (TCF1, Accession NM_000545) is another VGAM2488 host target gene. TCF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TCF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF1 BINDING SITE, designated SEQ ID:6150, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84264] Another function of VGAM2488 is therefore inhibition of Transcription Factor 1, Hepatic; LF-B1, Hepatic Nuclear Factor (HNF1), Albumin Proximal Factor (TCF1, Accession NM_000545), a gene which is required for the expression of several liver specific genes. binds to the inverted palindrome 5'-gttaatnattaac-3'. Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF1. The function of TCF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189.Translocase of Inner Mitochondrial Mem-

brane 23 Homolog (yeast) (TIMM23, Accession XM_011891) is another VGAM2488 host target gene. TIMM23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIMM23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMM23 BINDING SITE, designated SEQ ID:30198, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84265] Another function of VGAM2488 is therefore inhibition of Translocase of Inner Mitochondrial Membrane 23 Homolog (yeast) (TIMM23, Accession XM_011891), a gene which translocates nuclear-encoded proteins into the mitochondrion. Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMM23. The function of TIMM23 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.Diacylglycerol Kinase, Zeta 104kDa (DGKZ, Accession NM_003646) is another VGAM2488 host target

gene. DGKZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DGKZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKZ BINDING SITE, designated SEQ ID:9723, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84266] Another function of VGAM2488 is therefore inhibition of Diacylglycerol Kinase, Zeta 104kDa (DGKZ, Accession NM_003646). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKZ. FLJ14009 (Accession NM_024760) is another VGAM2488 host target gene. FLJ14009 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14009 BINDING SITE, designated SEQ ID:24111, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84267] Another function of VGAM2488 is therefore inhibition of FLJ14009 (Accession NM_024760). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14009. FLJ20085 (Accession NM_017660) is another VGAM2488 host target gene. FLJ20085 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20085 BINDING SITE, designated SEQ ID:19183, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84268] Another function of VGAM2488 is therefore inhibition of FLJ20085 (Accession NM_017660). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20085. FLJ20359 (Accession NM_017781) is another VGAM2488 host target gene. FLJ20359 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20359, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20359 BINDING SITE, designated SEQ ID:19413, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84269] Another function of VGAM2488 is therefore inhibition of FLJ20359 (Accession NM_017781). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20359. FLJ22056 (Accession NM_022489) is another VGAM2488 host target gene. FLJ22056 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22056 BINDING SITE, designated SEQ ID:22869, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84270] Another function of VGAM2488 is therefore inhibition of FLJ22056 (Accession NM_022489). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22056. HCA4 (Accession XM_085287) is another VGAM2488 host target gene. HCA4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:38019, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84271] Another function of VGAM2488 is therefore inhibition of HCA4 (Accession XM_085287). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA4. KIAA1576 (Accession XM_038186) is another VGAM2488 host target gene. KIAA1576 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1576 BINDING SITE, designated SEQ ID:32770, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5199.

[84272] Another function of VGAM2488 is therefore inhibition of KIAA1576 (Accession XM_038186). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1576. KIAA1727 (Accession XM_034262) is another VGAM2488 host target gene. KIAA1727 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:32034, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84273] Another function of VGAM2488 is therefore inhibition of KIAA1727 (Accession XM_034262). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727. MGC11115 (Accession NM_032310) is another VGAM2488 host target gene. MGC11115 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC11115, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11115 BINDING SITE, designated SEQ ID:26092, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84274] Another function of VGAM2488 is therefore inhibition of MGC11115 (Accession NM_032310). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11115. MGC16703 (Accession XM_054591) is another VGAM2488 host target gene. MGC16703 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC16703, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16703 BINDING SITE, designated SEQ ID:36181, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84275] Another function of VGAM2488 is therefore inhibition of MGC16703 (Accession XM_054591). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC16703. MGC3047 (Accession NM_032348) is another VGAM2488 host target gene. MGC3047 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3047 BINDING SITE, designated SEQ ID:26137, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84276] Another function of VGAM2488 is therefore inhibition of MGC3047 (Accession NM_032348). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3047. PP1665 (Accession NM_030792) is another VGAM2488 host target gene. PP1665 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PP1665, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1665 BINDING SITE, designated SEQ ID:25091, to the nucleotide se-

quence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84277] Another function of VGAM2488 is therefore inhibition of PP1665 (Accession NM_030792). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1665. SAST (Accession XM_032034) is another VGAM2488 host target gene. SAST BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SAST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAST BINDING SITE, designated SEQ ID:31540, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84278] Another function of VGAM2488 is therefore inhibition of SAST (Accession XM_032034). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAST. URG4 (Accession NM_017920) is another VGAM2488 host target gene. URG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by URG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of URG4 BINDING SITE, designated SEQ ID:19578, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84279] Another function of VGAM2488 is therefore inhibition of URG4 (Accession NM_017920). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with URG4. LOC124460 (Accession XM_071892) is another VGAM2488 host target gene. LOC124460 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124460 BINDING SITE, designated SEQ ID:37442, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84280] Another function of VGAM2488 is therefore inhibition of LOC124460 (Accession XM_071892). Accordingly, utilities

of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124460. LOC144483 (Accession XM_012219) is another VGAM2488 host target gene. LOC144483 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144483 BINDING SITE, designated SEQ ID:30211, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84281] Another function of VGAM2488 is therefore inhibition of LOC144483 (Accession XM_012219). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144483. LOC145447 (Accession XM_085133) is another VGAM2488 host target gene. LOC145447 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145447 BINDING SITE, designated SEQ ID:37862, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84282] Another function of VGAM2488 is therefore inhibition of LOC145447 (Accession XM_085133). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145447. LOC149706 (Accession XM_097718) is another VGAM2488 host target gene. LOC149706 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149706 BINDING SITE, designated SEQ ID:41060, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84283] Another function of VGAM2488 is therefore inhibition of LOC149706 (Accession XM_097718). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149706. LOC151178 (Accession XM_087117) is another VGAM2488 host target gene. LOC151178 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151178 BINDING SITE, designated SEQ ID:39069, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84284] Another function of VGAM2488 is therefore inhibition of LOC151178 (Accession XM_087117). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151178. LOC155061 (Accession XM_088139) is another VGAM2488 host target gene. LOC155061 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155061 BINDING SITE, designated SEQ ID:39537, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84285] Another function of VGAM2488 is therefore inhibition of

LOC155061 (Accession XM_088139). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155061. LOC155340 (Accession XM_055725) is another VGAM2488 host target gene. LOC155340 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC155340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155340 BINDING SITE, designated SEQ ID:36317, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84286] Another function of VGAM2488 is therefore inhibition of LOC155340 (Accession XM_055725). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155340. LOC157349 (Accession XM_088298) is another VGAM2488 host target gene. LOC157349 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE, designated SEQ ID:39596, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84287] Another function of VGAM2488 is therefore inhibition of LOC157349 (Accession XM_088298). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349. LOC196759 (Accession XM_113601) is another VGAM2488 host target gene. LOC196759 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196759 BINDING SITE, designated SEQ ID:42292, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84288] Another function of VGAM2488 is therefore inhibition of LOC196759 (Accession XM_113601). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196759. LOC199899 (Accession XM_117153) is an-

other VGAM2488 host target gene. LOC199899 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199899 BINDING SITE, designated SEQ ID:43257, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84289] Another function of VGAM2488 is therefore inhibition of LOC199899 (Accession XM_117153). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199899. LOC221495 (Accession XM_168136) is another VGAM2488 host target gene. LOC221495 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221495 BINDING SITE, designated SEQ ID:45062, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84290] Another function of VGAM2488 is therefore inhibition of LOC221495 (Accession XM_168136). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221495. LOC256598 (Accession XM_172816) is another VGAM2488 host target gene. LOC256598 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256598 BINDING SITE, designated SEQ ID:46098, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84291] Another function of VGAM2488 is therefore inhibition of LOC256598 (Accession XM_172816). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256598. LOC256867 (Accession XM_170694) is another VGAM2488 host target gene. LOC256867 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256867, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256867 BINDING SITE, designated SEQ ID:45474, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84292] Another function of VGAM2488 is therefore inhibition of LOC256867 (Accession XM_170694). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256867. LOC257054 (Accession XM_171010) is another VGAM2488 host target gene. LOC257054 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257054 BINDING SITE, designated SEQ ID:45781, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84293] Another function of VGAM2488 is therefore inhibition of LOC257054 (Accession XM_171010). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC257054. LOC64744 (Accession XM_029830) is another VGAM2488 host target gene. LOC64744 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC64744, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC64744 BINDING SITE, designated SEQ ID:30953, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84294] Another function of VGAM2488 is therefore inhibition of LOC64744 (Accession XM_029830). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC64744. LOC90288 (Accession XM_030669) is another VGAM2488 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31108, to the nucleotide sequence of VGAM2488 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5199.

[84295] Another function of VGAM2488 is therefore inhibition of LOC90288 (Accession XM_030669). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. LOC92080 (Accession XM_042704) is another VGAM2488 host target gene. LOC92080 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92080, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92080 BINDING SITE, designated SEQ ID:33759, to the nucleotide sequence of VGAM2488 RNA, herein designated VGAM RNA, also designated SEQ ID:5199.

[84296] Another function of VGAM2488 is therefore inhibition of LOC92080 (Accession XM_042704). Accordingly, utilities of VGAM2488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92080. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2489 (VGAM2489) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84297] VGAM2489 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2489 was detected is described hereinabove with reference to Figs. 1-8.

[84298] VGAM2489 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2489 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84299] VGAM2489 gene encodes a VGAM2489 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2489 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2489 precursor RNA is designated SEQ ID:2475, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2475 is located at position 131589 relative to the genome of Mouse Cytomegalovirus 1.

[84300] VGAM2489 precursor RNA folds onto itself, forming

VGAM2489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84301] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2489 folded precursor RNA into VGAM2489 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2489 RNA is designated SEQ ID:5200, and is provided hereinbelow with reference to the sequence listing part.

[84302] VGAM2489 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2489 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2489 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84303] VGAM2489 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2489 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2489 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2489 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2489 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84304] The complementary binding of VGAM2489 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2489 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2489 host target RNA into VGAM2489 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84305] It is appreciated that VGAM2489 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2489 host target genes. The mRNA of each one of this plurality of VGAM2489 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2489 RNA, herein designated VGAM RNA, and which when bound by VGAM2489 RNA causes inhibition of translation of respective one or more VGAM2489 host target proteins.

[84306] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2489 gene, herein designated VGAM GENE, on one or more VGAM2489 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84307] It is yet further appreciated that a function of VGAM2489 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2489 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2489 correlate with, and may be deduced from, the identity of the host target genes which VGAM2489 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[84308] Nucleotide sequences of the VGAM2489 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2489 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2489 are further described hereinbelow with reference to Table 1.

[84309] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2489 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2489 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84310] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2489 gene, herein designated VGAM is inhibition of expression of VGAM2489 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2489 correlate with, and may be deduced from, the identity of the target genes which VGAM2489 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[84311] Cadherin 1, Type 1, E-cadherin (epithelial) (CDH1, Accession NM_004360) is a VGAM2489 host target gene. CDH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH1 BINDING SITE, designated SEQ ID:10567, to the nucleotide sequence of VGAM2489 RNA, herein designated VGAM RNA, also designated SEQ ID:5200.

[84312] A function of VGAM2489 is therefore inhibition of Cadherin 1, Type 1, E-cadherin (epithelial) (CDH1, Accession NM_004360). Accordingly, utilities of VGAM2489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH1. Retinoblastoma Binding Protein 9 (RBBP9, Accession XM_046553) is another VGAM2489 host target gene. RBBP9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBBP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBBP9 BIND-

ING SITE, designated SEQ ID:34744, to the nucleotide sequence of VGAM2489 RNA, herein designated VGAM RNA, also designated SEQ ID:5200.

[84313] Another function of VGAM2489 is therefore inhibition of Retinoblastoma Binding Protein 9 (RBBP9, Accession XM_046553). Accordingly, utilities of VGAM2489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP9. BRCA2 and CDKN1A Interacting Protein (BCCIP, Accession NM_078469) is another VGAM2489 host target gene. BCCIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCCIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCCIP BINDING SITE, designated SEQ ID:27785, to the nucleotide sequence of VGAM2489 RNA, herein designated VGAM RNA, also designated SEQ ID:5200.

[84314] Another function of VGAM2489 is therefore inhibition of BRCA2 and CDKN1A Interacting Protein (BCCIP, Accession NM_078469). Accordingly, utilities of VGAM2489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCCIP. Fig. 1 further pro-

vides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2490 (VGAM2490) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84315] VGAM2490 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2490 was detected is described hereinabove with reference to Figs. 1-8.

[84316] VGAM2490 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2490 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84317] VGAM2490 gene encodes a VGAM2490 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2490 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2490 precursor RNA is designated SEQ ID:2476, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2476 is located at position 47693 relative to the genome of Mouse Cytomegalovirus 1.

[84318] VGAM2490 precursor RNA folds onto itself, forming VGAM2490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84319] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2490 folded precursor RNA into VGAM2490 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2490 RNA is designated SEQ ID:5201, and is provided hereinbelow with reference to the sequence listing part.

[84320] VGAM2490 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2490 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2490 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84321] VGAM2490 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2490 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2490 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2490 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2490 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84322] The complementary binding of VGAM2490 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2490 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2490 host target RNA into VGAM2490 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84323] It is appreciated that VGAM2490 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2490 host target genes. The mRNA of each one of this plurality of VGAM2490 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2490 RNA, herein designated VGAM RNA, and which when bound by VGAM2490 RNA causes inhibition of translation of respective one or more

VGAM2490 host target proteins.

[84324] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2490 gene, herein designated VGAM GENE, on one or more VGAM2490 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84325] It is yet further appreciated that a function of VGAM2490 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2490 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1.

Specific functions, and accordingly utilities, of VGAM2490 correlate with, and may be deduced from, the identity of the host target genes which VGAM2490 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84326] Nucleotide sequences of the VGAM2490 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2490 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2490 are further described hereinbelow with reference to Table 1.

[84327] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2490 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2490 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84328] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2490 gene, herein designated VGAM is inhibition of expression of VGAM2490 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2490 correlate with, and may be deduced from, the identity of the target genes which VGAM2490 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84329] Keratin 16 (focal non-epidermolytic palmoplantar keratoderma) (KRT16, Accession XM_170845) is a VGAM2490 host target gene. KRT16 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KRT16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KRT16 BINDING SITE, designated SEQ ID:45629, to the nucleotide sequence of VGAM2490 RNA, herein designated VGAM RNA, also designated SEQ ID:5201.

[84330] A function of VGAM2490 is therefore inhibition of Keratin 16 (focal non-epidermolytic palmoplantar keratoderma) (KRT16, Accession XM_170845). Accordingly, utilities of VGAM2490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRT16. Nescient Helix Loop Helix 1 (NHLH1, Accession NM_005598) is another VGAM2490 host target gene. NHLH1 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by NHLH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NHLH1 BINDING SITE, designated SEQ ID:12124, to the nucleotide sequence of VGAM2490 RNA, herein designated VGAM RNA, also designated SEQ ID:5201.

[84331] Another function of VGAM2490 is therefore inhibition of Nescient Helix Loop Helix 1 (NHLH1, Accession NM_005598), a gene which may have a role in development of the nervous system. Accordingly, utilities of VGAM2490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NHLH1. The function of NHLH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1923.Purinergic Receptor P2Y, G-protein Coupled, 2 (P2RY2, Accession NM_002564) is another VGAM2490 host target gene. P2RY2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by P2RY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RY2 BINDING SITE, designated SEQ ID:8414, to the nucleotide sequence of VGAM2490 RNA, herein designated VGAM RNA, also designated SEQ ID:5201.

[84332] Another function of VGAM2490 is therefore inhibition of Purinergic Receptor P2Y, G-protein Coupled, 2 (P2RY2, Accession NM_002564), a gene which mediates cellular responses to ATP. Accordingly, utilities of VGAM2490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY2. The function of P2RY2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1259.Proprotein Convertase Subtilisin/kexin Type 2 (PCSK2, Accession NM_002594) is another VGAM2490 host target gene. PCSK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCSK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCSK2 BINDING SITE, designated SEQ ID:8454, to the nucleotide sequence of

VGAM2490 RNA, herein designated VGAM RNA, also designated SEQ ID:5201.

[84333] Another function of VGAM2490 is therefore inhibition of Proprotein Convertase Subtilisin/kexin Type 2 (PCSK2, Accession NM_002594), a gene which is involved in the processing of hormone and other protein precursors at sites comprised of pairs of basic amino acid residues. Accordingly, utilities of VGAM2490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCSK2. The function of PCSK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1120.FLJ22009 (Accession XM_015700) is another VGAM2490 host target gene. FLJ22009 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22009 BINDING SITE, designated SEQ ID:30241, to the nucleotide sequence of VGAM2490 RNA, herein designated VGAM RNA, also designated SEQ ID:5201.

[84334] Another function of VGAM2490 is therefore inhibition of FLJ22009 (Accession XM_015700). Accordingly, utilities of VGAM2490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22009. Interferon Regulatory Factor 7 (IRF7, Accession NM_004030) is another VGAM2490 host target gene. IRF7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IRF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRF7 BINDING SITE, designated SEQ ID:10249, to the nucleotide sequence of VGAM2490 RNA, herein designated VGAM RNA, also designated SEQ ID:5201.

[84335] Another function of VGAM2490 is therefore inhibition of Interferon Regulatory Factor 7 (IRF7, Accession NM_004030). Accordingly, utilities of VGAM2490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRF7. NRF (Accession NM_017544) is another VGAM2490 host target gene. NRF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NRF, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRF BINDING SITE, designated SEQ ID:18985, to the nucleotide sequence of VGAM2490 RNA, herein designated VGAM RNA, also designated SEQ ID:5201.

[84336] Another function of VGAM2490 is therefore inhibition of NRF (Accession NM_017544). Accordingly, utilities of VGAM2490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRF. LOC200317 (Accession XM_114208) is another VGAM2490 host target gene. LOC200317 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200317 BINDING SITE, designated SEQ ID:42801, to the nucleotide sequence of VGAM2490 RNA, herein designated VGAM RNA, also designated SEQ ID:5201.

[84337] Another function of VGAM2490 is therefore inhibition of LOC200317 (Accession XM_114208). Accordingly, utilities of VGAM2490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200317. LOC91408 (Accession XM_038290) is another VGAM2490 host target gene. LOC91408 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91408 BINDING SITE, designated SEQ ID:32791, to the nucleotide sequence of VGAM2490 RNA, herein designated VGAM RNA, also designated SEQ ID:5201.

[84338] Another function of VGAM2490 is therefore inhibition of LOC91408 (Accession XM_038290). Accordingly, utilities of VGAM2490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91408. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2491 (VGAM2491) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84339] VGAM2491 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2491 was detected is described hereinabove with reference to Figs. 1-8.

[84340] VGAM2491 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2491 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84341] VGAM2491 gene encodes a VGAM2491 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2491 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2491 precursor RNA is designated SEQ ID:2477, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2477 is located at position 198448 relative to the genome of Mouse Cytomegalovirus 1.

[84342] VGAM2491 precursor RNA folds onto itself, forming VGAM2491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84343] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2491 folded precursor RNA into VGAM2491 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2491 RNA is designated SEQ ID:5202, and is provided hereinbelow with reference to the sequence listing part.

[84344] VGAM2491 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2491 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2491 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84345] VGAM2491 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2491 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2491 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2491 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2491 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84346] The complementary binding of VGAM2491 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2491 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2491 host target RNA into VGAM2491 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84347] It is appreciated that VGAM2491 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2491 host target genes. The mRNA of each one of this plurality of VGAM2491 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2491 RNA, herein designated VGAM RNA, and which when bound by VGAM2491 RNA causes inhibition of translation of respective one or more VGAM2491 host target proteins.

[84348] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2491 gene, herein designated VGAM GENE, on one or more VGAM2491 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84349] It is yet further appreciated that a function of VGAM2491 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2491 correlate with, and may be deduced from, the identity of the host target genes which VGAM2491 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84350] Nucleotide sequences of the VGAM2491 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2491 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2491 are further described hereinbelow with reference to Table 1.

[84351] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2491 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2491 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84352] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2491 gene, herein designated VGAM is inhibition of expression of VGAM2491 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2491 correlate with, and may be deduced from, the identity of the target genes which VGAM2491 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84353] Collagen, Type VI, Alpha 2 (COL6A2, Accession NM_058175) is a VGAM2491 host target gene. COL6A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL6A2,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL6A2 BINDING SITE, designated SEQ ID:27725, to the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, also designated SEQ ID:5202.

[84354] A function of VGAM2491 is therefore inhibition of Collagen, Type VI, Alpha 2 (COL6A2, Accession NM_058175). Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL6A2. Glucose-6-phosphate Dehydrogenase (G6PD, Accession NM_000402) is another VGAM2491 host target gene. G6PD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by G6PD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PD BINDING SITE, designated SEQ ID:5980, to the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, also designated SEQ ID:5202.

[84355] Another function of VGAM2491 is therefore inhibition of

Glucose-6-phosphate Dehydrogenase (G6PD, Accession NM_000402), a gene which produces pentose sugars for nucleic acid synthesis and main producer of nadph reducing power. Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PD. The function of G6PD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1027.DQX1 (Accession NM_133637) is another VGAM2491 host target gene. DQX1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DQX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DQX1 BINDING SITE, designated SEQ ID:28596, to the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, also designated SEQ ID:5202.

[84356] Another function of VGAM2491 is therefore inhibition of DQX1 (Accession NM_133637). Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DQX1. ETR101 (Accession XM_051364) is another VGAM2491

host target gene. ETR101 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ETR101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ETR101 BINDING SITE, designated SEQ ID:35830, to the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, also designated SEQ ID:5202.

[84357] Another function of VGAM2491 is therefore inhibition of ETR101 (Accession XM_051364). Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ETR101. FLJ14054 (Accession NM_024563) is another VGAM2491 host target gene. FLJ14054 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14054 BINDING SITE, designated SEQ ID:23781, to the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, also designated SEQ ID:5202.

[84358] Another function of VGAM2491 is therefore inhibition of FLJ14054 (Accession NM_024563). Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14054. KIAA1884 (Accession XM_055539) is another VGAM2491 host target gene. KIAA1884 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1884 BINDING SITE, designated SEQ ID:36296, to the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, also designated SEQ ID:5202.

[84359] Another function of VGAM2491 is therefore inhibition of KIAA1884 (Accession XM_055539). Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1884. SEC14-like 2 (S. cerevisiae) (SEC14L2, Accession NM_012429) is another VGAM2491 host target gene. SEC14L2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC14L2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC14L2 BINDING SITE, designated SEQ ID:14804, to the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, also designated SEQ ID:5202.

[84360] Another function of VGAM2491 is therefore inhibition of SEC14-like 2 (S. cerevisiae) (SEC14L2, Accession NM_012429). Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC14L2. LOC122769 (Accession XM_058657) is another VGAM2491 host target gene. LOC122769 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC122769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122769 BINDING SITE, designated SEQ ID:36695, to the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, also designated SEQ ID:5202.

[84361] Another function of VGAM2491 is therefore inhibition of LOC122769 (Accession XM_058657). Accordingly, utilities

of VGAM2491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122769. LOC151124 (Accession XM_098006) is another VGAM2491 host target gene. LOC151124 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151124, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151124 BINDING SITE, designated SEQ ID:41299, to the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, also designated SEQ ID:5202.

[84362] Another function of VGAM2491 is therefore inhibition of LOC151124 (Accession XM_098006). Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151124. LOC254016 (Accession XM_173050) is another VGAM2491 host target gene. LOC254016 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC254016 BINDING SITE, designated SEQ ID:46309, to the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, also designated SEQ ID:5202.

[84363] Another function of VGAM2491 is therefore inhibition of LOC254016 (Accession XM_173050). Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254016. LOC58509 (Accession XM_114002) is another VGAM2491 host target gene. LOC58509 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC58509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58509 BINDING SITE, designated SEQ ID:42612, to the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, also designated SEQ ID:5202.

[84364] Another function of VGAM2491 is therefore inhibition of LOC58509 (Accession XM_114002). Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58509. LOC64150 (Accession XM_040993) is another VGAM2491 host target gene. LOC64150 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC64150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC64150 BINDING SITE, designated SEQ ID:33411, to the nucleotide sequence of VGAM2491 RNA, herein designated VGAM RNA, also designated SEQ ID:5202.

[84365] Another function of VGAM2491 is therefore inhibition of LOC64150 (Accession XM_040993). Accordingly, utilities of VGAM2491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC64150. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2492 (VGAM2492) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84366] VGAM2492 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2492 was detected is described hereinabove with reference to Figs. 1-8.

[84367] VGAM2492 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2492 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84368] VGAM2492 gene encodes a VGAM2492 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2492 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2492 precursor RNA is designated SEQ ID:2478, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2478 is located at position 124024 relative to the genome of Mouse Cytomegalovirus 1.

[84369] VGAM2492 precursor RNA folds onto itself, forming VGAM2492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[84370] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2492 folded precursor RNA into VGAM2492 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM2492 RNA is designated SEQ ID:5203, and is provided hereinbelow with reference to the sequence listing part.

[84371] VGAM2492 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2492 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2492 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84372] VGAM2492 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2492 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2492 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2492 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2492 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84373] The complementary binding of VGAM2492 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2492 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2492 host target RNA into VGAM2492 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84374] It is appreciated that VGAM2492 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2492 host target genes. The mRNA of each one of this plurality of VGAM2492 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2492 RNA, herein designated VGAM RNA, and which when bound by VGAM2492 RNA causes inhibition of translation of respective one or more VGAM2492 host target proteins.

[84375] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2492 gene, herein designated VGAM GENE, on one or more VGAM2492 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84376] It is yet further appreciated that a function of VGAM2492 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2492 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2492 correlate with, and may be deduced from, the identity of the host target genes which VGAM2492 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84377] Nucleotide sequences of the VGAM2492 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2492 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2492 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2492 are further described hereinbelow with reference to Table 1.

[84378] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2492 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2492 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84379] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2492 gene, herein designated VGAM is inhibition of expression of VGAM2492 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2492 correlate with, and may be deduced from, the identity of the target genes which VGAM2492 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84380] AXL Receptor Tyrosine Kinase (AXL, Accession NM_001699) is a VGAM2492 host target gene. AXL BINDING SITE1 and AXL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AXL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE1 and AXL BINDING SITE2, designated SEQ ID:7419 and SEQ ID:22440 respectively, to the nucleotide sequence of VGAM2492 RNA, herein designated VGAM RNA, also designated SEQ ID:5203.

[84381] A function of VGAM2492 is therefore inhibition of AXL Receptor Tyrosine Kinase (AXL, Accession NM_001699). Accordingly, utilities of VGAM2492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL. EMILIN-2 (Accession NM_032048) is another VGAM2492 host target gene. EMILIN-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EMILIN-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMILIN-2 BINDING SITE, designated SEQ ID:25766, to the nucleotide sequence of VGAM2492 RNA, herein designated VGAM RNA, also designated SEQ ID:5203.

[84382] Another function of VGAM2492 is therefore inhibition of EMILIN-2 (Accession NM_032048). Accordingly, utilities of VGAM2492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMILIN-

2. FLJ21742 (Accession NM_032207) is another VGAM2492 host target gene. FLJ21742 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21742 BINDING SITE, designated SEQ ID:25912, to the nucleotide sequence of VGAM2492 RNA, herein designated VGAM RNA, also designated SEQ ID:5203.

[84383] Another function of VGAM2492 is therefore inhibition of FLJ21742 (Accession NM_032207). Accordingly, utilities of VGAM2492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21742. Ring Finger Protein 24 (RNF24, Accession NM_007219) is another VGAM2492 host target gene. RNF24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF24 BINDING SITE, designated SEQ ID:14083, to the nucleotide sequence of VGAM2492 RNA,

herein designated VGAM RNA, also designated SEQ ID:5203.

[84384] Another function of VGAM2492 is therefore inhibition of Ring Finger Protein 24 (RNF24, Accession NM_007219). Accordingly, utilities of VGAM2492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF24. LOC153577 (Accession XM_098394) is another VGAM2492 host target gene. LOC153577 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153577 BINDING SITE, designated SEQ ID:41641, to the nucleotide sequence of VGAM2492 RNA, herein designated VGAM RNA, also designated SEQ ID:5203.

[84385] Another function of VGAM2492 is therefore inhibition of LOC153577 (Accession XM_098394). Accordingly, utilities of VGAM2492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153577. LOC165140 (Accession XM_092406) is another VGAM2492 host target gene. LOC165140 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC165140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165140 BINDING SITE, designated SEQ ID:40116, to the nucleotide sequence of VGAM2492 RNA, herein designated VGAM RNA, also designated SEQ ID:5203.

[84386] Another function of VGAM2492 is therefore inhibition of LOC165140 (Accession XM_092406). Accordingly, utilities of VGAM2492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165140. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2493 (VGAM2493) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84387] VGAM2493 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2493 was detected is described hereinabove with reference to Figs. 1-8.

[84388] VGAM2493 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2493 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84389] VGAM2493 gene encodes a VGAM2493 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2493 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2493 precursor RNA is designated SEQ ID:2479, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2479 is located at position 160440 relative to the genome of Mouse Cytomegalovirus 1.

[84390] VGAM2493 precursor RNA folds onto itself, forming VGAM2493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[84391] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2493 folded precursor RNA into VGAM2493 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2493 RNA is designated SEQ ID:5204, and is provided hereinbelow with reference to the sequence listing part.

[84392] VGAM2493 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2493 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2493 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84393] VGAM2493 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2493 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2493 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2493 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2493 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84394] The complementary binding of VGAM2493 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2493 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2493 host target RNA into VGAM2493 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84395] It is appreciated that VGAM2493 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2493 host target genes. The mRNA of each one of this plurality of VGAM2493 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2493 RNA, herein designated VGAM RNA, and which when bound by VGAM2493 RNA causes inhibition of translation of respective one or more VGAM2493 host target proteins.

[84396] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2493 gene, herein designated VGAM GENE, on one or more VGAM2493 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84397] It is yet further appreciated that a function of VGAM2493 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2493 correlate with, and may be deduced from, the identity of the host target genes which VGAM2493 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84398] Nucleotide sequences of the VGAM2493 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2493 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2493 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2493 are further described hereinbelow with reference to Table 1.

[84399] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2493 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2493 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84400] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2493 gene, herein designated VGAM is inhibition of expression of VGAM2493 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2493 correlate with, and may be deduced from, the identity of the target genes which VGAM2493 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84401] Attractin (ATRN, Accession NM_139321) is a VGAM2493 host target gene. ATRN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of ATRN BINDING SITE, designated SEQ ID:29297, to the nucleotide sequence of VGAM2493 RNA, herein designated VGAM RNA, also designated SEQ ID:5204.

[84402] A function of VGAM2493 is therefore inhibition of Attractin (ATRN, Accession NM_139321), a gene which is involved in the initial immune cell clustering during inflammatory response. Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRN. The function of ATRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53.Cytochrome P450, Subfamily IIIA, Polypeptide 43 (CYP3A43, Accession NM_057096) is another VGAM2493 host target gene. CYP3A43 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP3A43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP3A43 BINDING SITE, designated SEQ ID:27662, to the nucleotide sequence of VGAM2493 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5204.

[84403] Another function of VGAM2493 is therefore inhibition of Cytochrome P450, Subfamily IIIA, Polypeptide 43 (CYP3A43, Accession NM_057096), a gene which may be involved in the metabolism of insect hormones and in the breakdown of synthetic insecticides. Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP3A43. The function of CYP3A43 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1216.Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM_012281) is another VGAM2493 host target gene. KCND2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND2 BINDING SITE, designated SEQ ID:14610, to the nucleotide sequence of VGAM2493 RNA, herein designated VGAM RNA, also designated SEQ ID:5204.

[84404] Another function of VGAM2493 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM_012281), a gene which is prominent in the repolarization phase of the action potential. Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCND2. The function of KCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM449.Solute Carrier Family 22 (organic cation transporter), Member 5 (SLC22A5, Accession NM_003060) is another VGAM2493 host target gene. SLC22A5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC22A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A5 BINDING SITE, designated SEQ ID:9028, to the nucleotide sequence of VGAM2493 RNA, herein designated VGAM RNA, also designated SEQ ID:5204.

[84405] Another function of VGAM2493 is therefore inhibition of Solute Carrier Family 22 (organic cation transporter),

Member 5 (SLC22A5, Accession NM_003060). Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A5. Transcription Factor 12 (HTF4, helix-loop-helix transcription factors 4) (TCF12, Accession NM_003205) is another VGAM2493 host target gene. TCF12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TCF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF12 BINDING SITE, designated SEQ ID:9203, to the nucleotide sequence of VGAM2493 RNA, herein designated VGAM RNA, also designated SEQ ID:5204.

[84406] Another function of VGAM2493 is therefore inhibition of Transcription Factor 12 (HTF4, helix-loop-helix transcription factors 4) (TCF12, Accession NM_003205), a gene which may play important roles during development of the nervous system as well as in other organ systems. Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF12. The function of TCF12 and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM308.Tumor Protein P53 (Li-Fraumeni syndrome) (TP53, Accession NM_000546) is another VGAM2493 host target gene. TP53 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TP53, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53 BINDING SITE, designated SEQ ID:6152, to the nucleotide sequence of VGAM2493 RNA, herein designated VGAM RNA, also designated SEQ ID:5204.

[84407] Another function of VGAM2493 is therefore inhibition of Tumor Protein P53 (Li-Fraumeni syndrome) (TP53, Accession NM_000546). Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53. MGC4172 (Accession NM_024308) is another VGAM2493 host target gene. MGC4172 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC4172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of MGC4172 BINDING SITE, designated SEQ ID:23600, to the nucleotide sequence of VGAM2493 RNA, herein designated VGAM RNA, also designated SEQ ID:5204.

[84408] Another function of VGAM2493 is therefore inhibition of MGC4172 (Accession NM_024308). Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4172. PDZ Domain Containing 2 (PDZD2, Accession XM_087705) is another VGAM2493 host target gene. PDZD2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PDZD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:39387, to the nucleotide sequence of VGAM2493 RNA, herein designated VGAM RNA, also designated SEQ ID:5204.

[84409] Another function of VGAM2493 is therefore inhibition of PDZ Domain Containing 2 (PDZD2, Accession XM_087705). Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PDZD2. RRN3 (Accession NM_018427) is another VGAM2493 host target gene. RRN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RRN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRN3 BINDING SITE, designated SEQ ID:20491, to the nucleotide sequence of VGAM2493 RNA, herein designated VGAM RNA, also designated SEQ ID:5204.

[84410] Another function of VGAM2493 is therefore inhibition of RRN3 (Accession NM_018427). Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRN3. LOC150951 (Accession XM_097975) is another VGAM2493 host target gene. LOC150951 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150951 BINDING SITE, designated SEQ ID:41276, to the nucleotide sequence of VGAM2493 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5204.

[84411] Another function of VGAM2493 is therefore inhibition of LOC150951 (Accession XM_097975). Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150951. LOC152274 (Accession XM_087418) is another VGAM2493 host target gene. LOC152274 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152274 BINDING SITE, designated SEQ ID:39233, to the nucleotide sequence of VGAM2493 RNA, herein designated VGAM RNA, also designated SEQ ID:5204.

[84412] Another function of VGAM2493 is therefore inhibition of LOC152274 (Accession XM_087418). Accordingly, utilities of VGAM2493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152274. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2494 (VGAM2494) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84413] VGAM2494 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2494 was detected is described hereinabove with reference to Figs. 1-8.

[84414] VGAM2494 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2494 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84415] VGAM2494 gene encodes a VGAM2494 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2494 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2494 precursor RNA is designated SEQ ID:2480, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2480 is located at position 208377 relative to the genome of Mouse Cytomegalovirus 1.

[84416] VGAM2494 precursor RNA folds onto itself, forming

VGAM2494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84417] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2494 folded precursor RNA into VGAM2494 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2494 RNA is designated SEQ ID:5205, and is provided hereinbelow with reference to the sequence listing part.

[84418] VGAM2494 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2494 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2494 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84419] VGAM2494 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2494 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2494 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2494 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2494 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84420] The complementary binding of VGAM2494 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2494 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2494 host target RNA into VGAM2494 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84421] It is appreciated that VGAM2494 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2494 host target genes. The mRNA of each one of this plurality of VGAM2494 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2494 RNA, herein designated VGAM RNA, and which when bound by VGAM2494 RNA causes inhibition of translation of respective one or more VGAM2494 host target proteins.

[84422] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2494 gene, herein designated VGAM GENE, on one or more VGAM2494 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84423] It is yet further appreciated that a function of VGAM2494 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2494 correlate with, and may be deduced from, the identity of the host target genes which VGAM2494 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[84424] Nucleotide sequences of the VGAM2494 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2494 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2494 are further described hereinbelow with reference to Table 1.

[84425] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2494 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2494 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84426] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2494 gene, herein designated VGAM is inhibition of expression of VGAM2494 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2494 correlate with, and may be deduced from, the identity of the target genes which VGAM2494 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[84427] V-raf Murine Sarcoma 3611 Viral Oncogene Homolog 1 (ARAF1, Accession XM_033884) is a VGAM2494 host target gene. ARAF1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARAF1 BINDING SITE, designated SEQ ID:31981, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84428] A function of VGAM2494 is therefore inhibition of V-raf Murine Sarcoma 3611 Viral Oncogene Homolog 1 (ARAF1, Accession XM_033884), a gene which may play a critical role in cell growth and development. Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARAF1. The function of ARAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM996.Calcium/calmodulin-dependent Protein Kinase IV (CAMK4, Accession NM_001744) is an-

other VGAM2494 host target gene. CAMK4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAMK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMK4 BINDING SITE, designated SEQ ID:7481, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84429] Another function of VGAM2494 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase IV (CAMK4, Accession NM_001744), a gene which is a heat-stable, acidic, calmodulin-binding protein. Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMK4. The function of CAMK4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM578.CD34 Antigen (CD34, Accession NM_001773) is another VGAM2494 host target gene. CD34 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD34, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD34 BINDING SITE, designated SEQ ID:7535, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84430] Another function of VGAM2494 is therefore inhibition of CD34 Antigen (CD34, Accession NM_001773), a gene which is a monomeric cell surface antigen that is selectively expressed on human hematopoietic progenitor cells. Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD34. The function of CD34 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006) is another VGAM2494 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:7737, to the nucleotide sequence of

VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84431] Another function of VGAM2494 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51.Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193) is another VGAM2494 host target gene. FZD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FZD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ ID:14486, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84432] Another function of VGAM2494 is therefore inhibition of Frizzled Homolog 4 (Drosophila) (FZD4, Accession

NM_012193), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled receptor family, has seven transmembrane domains. Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD4. The function of FZD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309.Maltase-glucoamylase (alpha-glucosidase) (MGAM, Accession XM_051351) is another VGAM2494 host target gene. MGAM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAM BINDING SITE, designated SEQ ID:35824, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84433] Another function of VGAM2494 is therefore inhibition of Maltase-glucoamylase (alpha-glucosidase) (MGAM, Accession XM_051351), a gene which plays a role in the final

steps of digestion of starch. Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAM. The function of MGAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM791.Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 13 (SERPINB13, Accession NM_012397) is another VGAM2494 host target gene. SERPINB13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SERPINB13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB13 BINDING SITE, designated SEQ ID:14763, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84434] Another function of VGAM2494 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 13 (SERPINB13, Accession NM_012397), a gene which plays a role in the proliferation or differentiation of keratinocytes. Accordingly, utilities of

VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB13. The function of SERPINB13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1924.Sarcoglycan, Gamma (35kDa dystrophin-associated glycoprotein) (SGCG, Accession NM_000231) is another VGAM2494 host target gene. SGCG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SGCG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGCG BINDING SITE, designated SEQ ID:5742, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84435] Another function of VGAM2494 is therefore inhibition of Sarcoglycan, Gamma (35kDa dystrophin-associated glycoprotein) (SGCG, Accession NM_000231). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGCG. VENT-like Homeobox 2 (VENTX2, Accession NM_014468) is another VGAM2494 host target gene.

VENTX2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VENTX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VENTX2 BINDING SITE, designated SEQ ID:15816, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84436] Another function of VGAM2494 is therefore inhibition of VENT-like Homeobox 2 (VENTX2, Accession NM_014468). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VENTX2. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM2494 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:21144, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA,

also designated SEQ ID:5205.

[84437] Another function of VGAM2494 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ10936 (Accession NM_018279) is another VGAM2494 host target gene. FLJ10936 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10936 BINDING SITE, designated SEQ ID:20270, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84438] Another function of VGAM2494 is therefore inhibition of FLJ10936 (Accession NM_018279). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10936. KIAA0763 (Accession NM_014869) is another VGAM2494 host target gene. KIAA0763 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA0763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0763 BINDING SITE, designated SEQ ID:16970, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84439] Another function of VGAM2494 is therefore inhibition of KIAA0763 (Accession NM_014869). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0763. KIAA1297 (Accession XM_051005) is another VGAM2494 host target gene. KIAA1297 BINDING SITE1 and KIAA1297 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1297, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE1 and KIAA1297 BINDING SITE2, designated SEQ ID:35716 and SEQ ID:35717 respectively, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84440] Another function of VGAM2494 is therefore inhibition of KIAA1297 (Accession XM_051005). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. MGC2865 (Accession NM_032375) is another VGAM2494 host target gene. MGC2865 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2865 BINDING SITE, designated SEQ ID:26167, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84441] Another function of VGAM2494 is therefore inhibition of MGC2865 (Accession NM_032375). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2865. MGC9753 (Accession NM_033419) is another VGAM2494 host target gene. MGC9753 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC9753, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC9753 BINDING SITE, designated SEQ ID:27242, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84442] Another function of VGAM2494 is therefore inhibition of MGC9753 (Accession NM_033419). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC9753. Methionine Sulfoxide Reductase A (MSRA, Accession NM_012331) is another VGAM2494 host target gene. MSRA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MSRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSRA BINDING SITE, designated SEQ ID:14721, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84443] Another function of VGAM2494 is therefore inhibition of Methionine Sulfoxide Reductase A (MSRA, Accession NM_012331). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with MSRA. Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM_138714) is another VGAM2494 host target gene. NFAT5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NFAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:28957, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84444] Another function of VGAM2494 is therefore inhibition of Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM_138714). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5. PR Domain Containing 13 (PRDM13, Accession NM_021620) is another VGAM2494 host target gene. PRDM13 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRDM13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PRDM13 BINDING SITE, designated SEQ ID:22255, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84445] Another function of VGAM2494 is therefore inhibition of PR Domain Containing 13 (PRDM13, Accession NM_021620). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM13. PSR (Accession XM_036784) is another VGAM2494 host target gene. PSR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSR BINDING SITE, designated SEQ ID:32501, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84446] Another function of VGAM2494 is therefore inhibition of PSR (Accession XM_036784). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSR.

LOC134689 (Accession XM_068963) is another VGAM2494 host target gene. LOC134689 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC134689, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134689 BINDING SITE, designated SEQ ID:37383, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84447] Another function of VGAM2494 is therefore inhibition of LOC134689 (Accession XM_068963). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134689. LOC151507 (Accession XM_087225) is another VGAM2494 host target gene. LOC151507 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151507 BINDING SITE, designated SEQ ID:39126, to the nucleotide sequence of VGAM2494 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5205.

[84448] Another function of VGAM2494 is therefore inhibition of LOC151507 (Accession XM_087225). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151507. LOC164295 (Accession XM_092767) is another VGAM2494 host target gene. LOC164295 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC164295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164295 BINDING SITE, designated SEQ ID:40142, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84449] Another function of VGAM2494 is therefore inhibition of LOC164295 (Accession XM_092767). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164295. LOC219513 (Accession XM_169166) is another VGAM2494 host target gene. LOC219513 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219513, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219513 BINDING SITE, designated SEQ ID:45295, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84450] Another function of VGAM2494 is therefore inhibition of LOC219513 (Accession XM_169166). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219513. LOC253737 (Accession XM_171409) is another VGAM2494 host target gene. LOC253737 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253737 BINDING SITE, designated SEQ ID:46046, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84451] Another function of VGAM2494 is therefore inhibition of LOC253737 (Accession XM_171409). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC253737. LOC51631 (Accession XM_042779) is another VGAM2494 host target gene. LOC51631 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51631, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51631 BINDING SITE, designated SEQ ID:33768, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84452] Another function of VGAM2494 is therefore inhibition of LOC51631 (Accession XM_042779). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51631. LOC58509 (Accession XM_114002) is another VGAM2494 host target gene. LOC58509 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC58509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58509 BINDING SITE, designated SEQ ID:42613, to the

nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84453] Another function of VGAM2494 is therefore inhibition of LOC58509 (Accession XM_114002). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58509. LOC93070 (Accession XM_049046) is another VGAM2494 host target gene. LOC93070 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93070 BINDING SITE, designated SEQ ID:35325, to the nucleotide sequence of VGAM2494 RNA, herein designated VGAM RNA, also designated SEQ ID:5205.

[84454] Another function of VGAM2494 is therefore inhibition of LOC93070 (Accession XM_049046). Accordingly, utilities of VGAM2494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93070. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2495 (VGAM2495) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84455] VGAM2495 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2495 was detected is described hereinabove with reference to Figs. 1-8.

[84456] VGAM2495 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2495 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84457] VGAM2495 gene encodes a VGAM2495 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2495 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2495 precursor RNA is designated SEQ ID:2481, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2481 is located at position 106389 relative to the genome of Mouse Cytomegalovirus 1.

[84458] VGAM2495 precursor RNA folds onto itself, forming VGAM2495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84459] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2495 folded precursor RNA into VGAM2495 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2495 RNA is designated SEQ ID:5206, and is provided hereinbelow with reference to the sequence listing part.

[84460] VGAM2495 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2495 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2495 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84461] VGAM2495 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2495 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2495 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2495 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2495 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84462] The complementary binding of VGAM2495 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2495 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2495 host target RNA into VGAM2495 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84463] It is appreciated that VGAM2495 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2495 host target genes. The mRNA of each one of this plurality of VGAM2495 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2495 RNA, herein designated VGAM RNA, and which when bound by VGAM2495 RNA causes inhibition of translation of respective one or more VGAM2495 host target proteins.

[84464] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2495 gene, herein designated VGAM GENE, on one or more VGAM2495 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84465] It is yet further appreciated that a function of VGAM2495 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2495 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2495 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2495 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84466] Nucleotide sequences of the VGAM2495 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2495 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2495 are further described hereinbelow with reference to Table 1.

[84467] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2495 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2495 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84468] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2495 gene, herein designated VGAM is inhibition of expression of VGAM2495 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2495 correlate with, and may be deduced from, the identity of the target genes which VGAM2495

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84469] HRIHFB2436 (Accession NM_014345) is a VGAM2495 host target gene. HRIHFB2436 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HRIHFB2436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRIHFB2436 BINDING SITE, designated SEQ ID:15665, to the nucleotide sequence of VGAM2495 RNA, herein designated VGAM RNA, also designated SEQ ID:5206.

[84470] A function of VGAM2495 is therefore inhibition of HRIHFB2436 (Accession NM_014345). Accordingly, utilities of VGAM2495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRIHFB2436. MGC12921 (Accession XM_033362) is another VGAM2495 host target gene. MGC12921 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC12921, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC12921 BINDING SITE, designated SEQ ID:31899, to the nucleotide sequence of VGAM2495 RNA, herein designated VGAM RNA, also designated SEQ ID:5206.

[84471] Another function of VGAM2495 is therefore inhibition of MGC12921 (Accession XM_033362). Accordingly, utilities of VGAM2495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12921. LOC153579 (Accession XM_087714) is another VGAM2495 host target gene. LOC153579 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153579 BINDING SITE, designated SEQ ID:39405, to the nucleotide sequence of VGAM2495 RNA, herein designated VGAM RNA, also designated SEQ ID:5206.

[84472] Another function of VGAM2495 is therefore inhibition of LOC153579 (Accession XM_087714). Accordingly, utilities of VGAM2495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153579. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2496 (VGAM2496) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84473] VGAM2496 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2496 was detected is described hereinabove with reference to Figs. 1-8.

[84474] VGAM2496 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2496 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84475] VGAM2496 gene encodes a VGAM2496 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2496 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2496 precursor RNA is designated SEQ ID:2482, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2482 is located at position 186483 relative to the

genome of Mouse Cytomegalovirus 1.

[84476] VGAM2496 precursor RNA folds onto itself, forming VGAM2496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84477] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2496 folded precursor RNA into VGAM2496 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2496 RNA is designated SEQ ID:5207, and is provided hereinbelow with reference to the sequence listing part.

[84478] VGAM2496 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2496 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2496 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84479] VGAM2496 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2496 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2496 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2496 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2496 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84480] The complementary binding of VGAM2496 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2496 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2496 host target RNA into VGAM2496 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84481] It is appreciated that VGAM2496 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2496 host target genes. The mRNA of each one of this plurality of VGAM2496 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2496 RNA, herein designated VGAM RNA, and which when bound by VGAM2496 RNA causes inhibition of translation of respective one or more VGAM2496 host target proteins.

[84482] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2496 gene, herein designated VGAM GENE, on one or more VGAM2496 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84483] It is yet further appreciated that a function of VGAM2496 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2496 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2496

correlate with, and may be deduced from, the identity of the host target genes which VGAM2496 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84484] Nucleotide sequences of the VGAM2496 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2496 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2496 are further described hereinbelow with reference to Table 1.

[84485] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2496 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2496 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84486] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2496 gene, herein designated VGAM is inhibition of expression of VGAM2496 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2496 correlate with, and may be deduced

from, the identity of the target genes which VGAM2496 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84487] Podocalyxin-like (PODXL, Accession NM_005397) is a VGAM2496 host target gene. PODXL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PODXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PODXL BINDING SITE, designated SEQ ID:11874, to the nucleotide sequence of VGAM2496 RNA, herein designated VGAM RNA, also designated SEQ ID:5207.

[84488] A function of VGAM2496 is therefore inhibition of Podocalyxin-like (PODXL, Accession NM_005397), a gene which is an antiadhesin. Accordingly, utilities of VGAM2496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PODXL. The function of PODXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.Artemin (ARTN, Accession NM_003976) is another VGAM2496 host target gene. ARTN BINDING SITE

is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARTN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARTN BINDING SITE, designated SEQ ID:10110, to the nucleotide sequence of VGAM2496 RNA, herein designated VGAM RNA, also designated SEQ ID:5207.

[84489] Another function of VGAM2496 is therefore inhibition of Artemin (ARTN, Accession NM_003976). Accordingly, utilities of VGAM2496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARTN. FLJ23191 (Accession NM_024574) is another VGAM2496 host target gene. FLJ23191 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23191 BINDING SITE, designated SEQ ID:23804, to the nucleotide sequence of VGAM2496 RNA, herein designated VGAM RNA, also designated SEQ ID:5207.

[84490] Another function of VGAM2496 is therefore inhibition of

FLJ23191 (Accession NM_024574). Accordingly, utilities of VGAM2496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23191. FLJ23323 (Accession NM_024654) is another VGAM2496 host target gene. FLJ23323 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23323 BINDING SITE, designated SEQ ID:23955, to the nucleotide sequence of VGAM2496 RNA, herein designated VGAM RNA, also designated SEQ ID:5207.

[84491] Another function of VGAM2496 is therefore inhibition of FLJ23323 (Accession NM_024654). Accordingly, utilities of VGAM2496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23323. Neuron Navigator 3 (NAV3, Accession NM_014903) is another VGAM2496 host target gene. NAV3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NAV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of NAV3 BINDING SITE, designated SEQ ID:17091, to the nucleotide sequence of VGAM2496 RNA, herein designated VGAM RNA, also designated SEQ ID:5207.

[84492] Another function of VGAM2496 is therefore inhibition of Neuron Navigator 3 (NAV3, Accession NM_014903). Accordingly, utilities of VGAM2496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAV3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2497 (VGAM2497) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84493] VGAM2497 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2497 was detected is described hereinabove with reference to Figs. 1-8.

[84494] VGAM2497 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2497 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[84495] VGAM2497 gene encodes a VGAM2497 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2497 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2497 precursor RNA is designated SEQ ID:2483, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2483 is located at position 212016 relative to the genome of Mouse Cytomegalovirus 1.

[84496] VGAM2497 precursor RNA folds onto itself, forming VGAM2497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84497] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2497 folded precursor RNA into VGAM2497 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2497 RNA is designated SEQ ID:5208, and is provided hereinbelow with reference to the sequence listing part.

[84498] VGAM2497 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2497 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2497 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84499] VGAM2497 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2497 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2497 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2497 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2497 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84500] The complementary binding of VGAM2497 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2497 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2497 host target RNA into VGAM2497 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84501] It is appreciated that VGAM2497 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2497 host target genes. The mRNA of each one of this plurality of VGAM2497 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2497 RNA, herein designated VGAM RNA, and which when bound by VGAM2497 RNA causes inhibition of translation of respective one or more VGAM2497 host target proteins.

[84502] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2497 gene, herein designated VGAM GENE, on one or more VGAM2497 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84503] It is yet further appreciated that a function of VGAM2497 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2497 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2497 correlate with, and may be deduced from, the identity of the host target genes which VGAM2497 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84504] Nucleotide sequences of the VGAM2497 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2497 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2497 are further described hereinbelow with reference to Table 1.

[84505] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2497 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2497 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84506] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2497 gene, herein designated VGAM is inhibition of expression of VGAM2497 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2497 correlate with, and may be deduced from, the identity of the target genes which VGAM2497 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84507] Fanconi Anemia, Complementation Group A (FANCA, Accession NM_000135) is a VGAM2497 host target gene. FANCA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FANCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCA BINDING SITE, designated SEQ ID:5629, to the nucleotide sequence of VGAM2497 RNA, herein designated VGAM RNA, also designated SEQ

ID:5208.

[84508] A function of VGAM2497 is therefore inhibition of Fanconi Anemia, Complementation Group A (FANCA, Accession NM_000135). Accordingly, utilities of VGAM2497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCA. Myelin Basic Protein (MBP, Accession XM_117096) is another VGAM2497 host target gene. MBP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBP BINDING SITE, designated SEQ ID:43222, to the nucleotide sequence of VGAM2497 RNA, herein designated VGAM RNA, also designated SEQ ID:5208.

[84509] Another function of VGAM2497 is therefore inhibition of Myelin Basic Protein (MBP, Accession XM_117096), a gene which Myelin basic protein; a constituent of myelin, plays a role in nerve function. Accordingly, utilities of VGAM2497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBP. The function of MBP and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.Myosin ID (MYO1D, Accession XM_050041) is another VGAM2497 host target gene. MYO1D BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MYO1D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO1D BINDING SITE, designated SEQ ID:35549, to the nucleotide sequence of VGAM2497 RNA, herein designated VGAM RNA, also designated SEQ ID:5208.

[84510] Another function of VGAM2497 is therefore inhibition of Myosin ID (MYO1D, Accession XM_050041), a gene which is an unconventional myosin. Accordingly, utilities of VGAM2497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO1D. The function of MYO1D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM126.MGC2817 (Accession XM_046613) is another VGAM2497 host target gene. MGC2817 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by MGC2817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2817 BINDING SITE, designated SEQ ID:34764, to the nucleotide sequence of VGAM2497 RNA, herein designated VGAM RNA, also designated SEQ ID:5208.

[84511] Another function of VGAM2497 is therefore inhibition of MGC2817 (Accession XM_046613). Accordingly, utilities of VGAM2497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2817. SEC24 Related Gene Family, Member D (S. cerevisiae) (SEC24D, Accession NM_014822) is another VGAM2497 host target gene. SEC24D BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SEC24D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC24D BINDING SITE, designated SEQ ID:16799, to the nucleotide sequence of VGAM2497 RNA, herein designated VGAM RNA, also designated SEQ ID:5208.

[84512] Another function of VGAM2497 is therefore inhibition of

SEC24 Related Gene Family, Member D (S. cerevisiae) (SEC24D, Accession NM_014822). Accordingly, utilities of VGAM2497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC24D. Ubiquitin Specific Protease 2 (USP2, Accession NM_004205) is another VGAM2497 host target gene. USP2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by USP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP2 BINDING SITE, designated SEQ ID:10402, to the nucleotide sequence of VGAM2497 RNA, herein designated VGAM RNA, also designated SEQ ID:5208.

[84513] Another function of VGAM2497 is therefore inhibition of Ubiquitin Specific Protease 2 (USP2, Accession NM_004205). Accordingly, utilities of VGAM2497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP2. XPO5 (Accession XM_166042) is another VGAM2497 host target gene. XPO5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by XPO5, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPO5 BINDING SITE, designated SEQ ID:43841, to the nucleotide sequence of VGAM2497 RNA, herein designated VGAM RNA, also designated SEQ ID:5208.

[84514] Another function of VGAM2497 is therefore inhibition of XPO5 (Accession XM_166042). Accordingly, utilities of VGAM2497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPO5. LOC153603 (Accession XM_087715) is another VGAM2497 host target gene. LOC153603 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153603, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153603 BINDING SITE, designated SEQ ID:39406, to the nucleotide sequence of VGAM2497 RNA, herein designated VGAM RNA, also designated SEQ ID:5208.

[84515] Another function of VGAM2497 is therefore inhibition of LOC153603 (Accession XM_087715). Accordingly, utilities of VGAM2497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC153603. LOC164714 (Accession XM_104657) is another VGAM2497 host target gene. LOC164714 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC164714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164714 BINDING SITE, designated SEQ ID:42178, to the nucleotide sequence of VGAM2497 RNA, herein designated VGAM RNA, also designated SEQ ID:5208.

[84516] Another function of VGAM2497 is therefore inhibition of LOC164714 (Accession XM_104657). Accordingly, utilities of VGAM2497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164714. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2498 (VGAM2498) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84517] VGAM2498 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2498 was detected is described hereinabove with reference to Figs. 1-8.

[84518] VGAM2498 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2498 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84519] VGAM2498 gene encodes a VGAM2498 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2498 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2498 precursor RNA is designated SEQ ID:2484, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2484 is located at position 211848 relative to the genome of Mouse Cytomegalovirus 1.

[84520] VGAM2498 precursor RNA folds onto itself, forming VGAM2498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84521] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2498 folded precursor RNA into VGAM2498 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM2498 RNA is designated SEQ ID:5209, and is provided hereinbelow with reference to the sequence listing part.

[84522] VGAM2498 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2498 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2498 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84523] VGAM2498 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2498 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2498 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2498 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2498 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84524] The complementary binding of VGAM2498 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2498 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2498 host target RNA into VGAM2498 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84525] It is appreciated that VGAM2498 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2498 host target genes. The mRNA of each one of this plurality of VGAM2498 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2498 RNA, herein designated VGAM RNA, and which when bound by VGAM2498 RNA causes inhibition of translation of respective one or more VGAM2498 host target proteins.

[84526] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2498 gene, herein designated VGAM GENE, on one or more VGAM2498 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84527] It is yet further appreciated that a function of VGAM2498 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2498 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2498 correlate with, and may be deduced from, the identity of the host target genes which VGAM2498 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84528] Nucleotide sequences of the VGAM2498 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2498 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2498 are further described hereinbelow with reference to Table 1.

[84529] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2498 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2498 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84530] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2498 gene, herein designated VGAM is inhibition of expression of VGAM2498 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2498 correlate with, and may be deduced from, the identity of the target genes which VGAM2498 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84531] Cas-Br-M (murine) Ecotropic Retroviral Transforming Sequence B (CBLB, Accession NM_004351) is a VGAM2498 host target gene. CBLB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by CBLB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBLB BINDING SITE, designated SEQ ID:10552, to the nucleotide sequence of VGAM2498 RNA, herein designated VGAM RNA, also designated SEQ ID:5209.

[84532] A function of VGAM2498 is therefore inhibition of Cas-Br-M (murine) Ecotropic Retroviral Transforming Sequence B (CBLB, Accession NM_004351), a gene which SH3 binding protein with similarity to human CBL; interacts and regulates signal transduction proteins. Accordingly, utilities of VGAM2498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBLB. The function of CBLB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM401.Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM_014246) is another VGAM2498 host target gene. CELSR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CELSR1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR1 BINDING SITE, designated SEQ ID:15515, to the nucleotide sequence of VGAM2498 RNA, herein designated VGAM RNA, also designated SEQ ID:5209.

[84533] Another function of VGAM2498 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM_014246), a gene which is involved in contact-mediated communication. Accordingly, utilities of VGAM2498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR1. The function of CELSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459.Protein Kinase C, Eta (PRKCH, Accession NM_006255) is another VGAM2498 host target gene. PRKCH BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRKCH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PRKCH BINDING SITE, designated SEQ ID:12934, to the nucleotide sequence of VGAM2498 RNA, herein designated VGAM RNA, also designated SEQ ID:5209.

[84534] Another function of VGAM2498 is therefore inhibition of Protein Kinase C, Eta (PRKCH, Accession NM_006255), a gene which is calcium-independent, phospholipid-dependent, serine- and threonine-specific enzyme. Accordingly, utilities of VGAM2498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCH. The function of PRKCH has been established by previous studies. Protein kinase C (PKC) is involved in one of the major signal transduction systems, which is activated upon external stimulation of cells by various ligands. For further background information on the PKC family, see PRKCA (OMIM Ref. No. 176960). By screening a human keratinocyte cDNA library using PRKCA fragments as probes, Bacher et al. (1991) isolated a cDNA encoding PRKCH, which they called PKCL. The predicted PRKCH protein contains 680 amino acids and shows highest homology with PRKCE (OMIM Ref. No. 176975). PRKCH has a consensus ATP-binding site, a catalytic kinase domain, and a conserved cysteine-rich domain. Northern blot

analysis of rat tissues detected a 4.2-kb transcript at highest levels in lung, with lower levels in heart and skin. The PRKCH transcript was also detected in the human skin carcinoma cell line SCL-1, the human epidermoid carcinoma cell line A431, and in HaCaT human skin keratinocytes. Transfection of COS cells with a PRKCH expression vector determined that this protein has phorbol ester-binding ability and kinase activity. By FISH, Quan and Fisher (1999) mapped the PRKCH gene to 14q22-q23

[84535] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[84536] Bacher, N.; Zisman, Y.; Berent, E.; Livneh, E. : Isolation and characterization of PKC-L, a new member of the protein kinase C-related gene family specifically expressed in lung, skin, and heart. Molec. Cell. Biol. 11: 126-133, 1991. ; and

[84537] Quan, T.; Fisher, G. J. : Cloning and characterization of the human protein kinase C-eta promoter. J. Biol. Chem. 274: 28566-28574, 1999.

[84538] Further studies establishing the function and utilities of PRKCH are found in John Hopkins OMIM database record ID 605437, and in sited publications numbered

4429-4430 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Retinoid X Receptor, Alpha (RXRA, Accession NM_002957) is another VGAM2498 host target gene. RXRA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RXRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RXRA BINDING SITE, designated SEQ ID:8870, to the nucleotide sequence of VGAM2498 RNA, herein designated VGAM RNA, also designated SEQ ID:5209.

[84539] Another function of VGAM2498 is therefore inhibition of Retinoid X Receptor, Alpha (RXRA, Accession NM_002957), a gene which activates genes required for vitamin A metabolism, binds 9-cis retinoic acid. Accordingly, utilities of VGAM2498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RXRA. The function of RXRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM349.A Kinase (PRKA) Anchor Protein (gravin) 12 (AKAP12, Accession NM_144497) is another

VGAM2498 host target gene. AKAP12 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AKAP12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP12 BINDING SITE, designated SEQ ID:29313, to the nucleotide sequence of VGAM2498 RNA, herein designated VGAM RNA, also designated SEQ ID:5209.

[84540] Another function of VGAM2498 is therefore inhibition of A Kinase (PRKA) Anchor Protein (gravin) 12 (AKAP12, Accession NM_144497). Accordingly, utilities of VGAM2498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP12. KIAA0644 (Accession NM_014817) is another VGAM2498 host target gene. KIAA0644 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0644 BINDING SITE, designated SEQ ID:16784, to the nucleotide sequence of VGAM2498 RNA, herein designated VGAM RNA, also designated SEQ

ID:5209.

[84541] Another function of VGAM2498 is therefore inhibition of KIAA0644 (Accession NM_014817). Accordingly, utilities of VGAM2498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0644. LOC152345 (Accession XM_087442) is another VGAM2498 host target gene. LOC152345 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152345, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152345 BINDING SITE, designated SEQ ID:39266, to the nucleotide sequence of VGAM2498 RNA, herein designated VGAM RNA, also designated SEQ ID:5209.

[84542] Another function of VGAM2498 is therefore inhibition of LOC152345 (Accession XM_087442). Accordingly, utilities of VGAM2498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152345. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2499 (VGAM2499) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84543] VGAM2499 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2499 was detected is described hereinabove with reference to Figs. 1-8.

[84544] VGAM2499 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2499 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84545] VGAM2499 gene encodes a VGAM2499 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2499 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2499 precursor RNA is designated SEQ ID:2485, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2485 is located at position 88282 relative to the genome of Mouse Cytomegalovirus 1.

[84546] VGAM2499 precursor RNA folds onto itself, forming

VGAM2499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84547] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2499 folded precursor RNA into VGAM2499 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2499 RNA is designated SEQ ID:5210, and is provided hereinbelow with reference to the sequence listing part.

[84548] VGAM2499 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2499 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2499 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84549] VGAM2499 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2499 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2499 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2499 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2499 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84550] The complementary binding of VGAM2499 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2499 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2499 host target RNA into VGAM2499 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84551] It is appreciated that VGAM2499 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2499 host target genes. The mRNA of each one of this plurality of VGAM2499 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2499 RNA, herein designated VGAM RNA, and which when bound by VGAM2499 RNA causes inhibition of translation of respective one or more VGAM2499 host target proteins.

[84552] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2499 gene, herein designated VGAM GENE, on one or more VGAM2499 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84553] It is yet further appreciated that a function of VGAM2499 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2499 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2499 correlate with, and may be deduced from, the identity of the host target genes which VGAM2499 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[84554] Nucleotide sequences of the VGAM2499 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2499 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2499 are further described hereinbelow with reference to Table 1.

[84555] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2499 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2499 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84556] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2499 gene, herein designated VGAM is inhibition of expression of VGAM2499 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2499 correlate with, and may be deduced from, the identity of the target genes which VGAM2499 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[84557] GASC1 (Accession XM_034624) is a VGAM2499 host target gene. GASC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GASC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GASC1 BINDING SITE, designated SEQ ID:32124, to the nucleotide sequence of VGAM2499 RNA, herein designated VGAM RNA, also designated SEQ ID:5210.

[84558] A function of VGAM2499 is therefore inhibition of GASC1 (Accession XM_034624), a gene which may play an important role in the development and/or progression of various types of cancer . Accordingly, utilities of VGAM2499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GASC1. The function of GASC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1671.Insulinoma-associated 1 (INSM1, Accession NM_002196) is another VGAM2499 host target gene. INSM1 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by INSM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INSM1 BINDING SITE, designated SEQ ID:7951, to the nucleotide sequence of VGAM2499 RNA, herein designated VGAM RNA, also designated SEQ ID:5210.

[84559] Another function of VGAM2499 is therefore inhibition of Insulinoma-associated 1 (INSM1, Accession NM_002196). Accordingly, utilities of VGAM2499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INSM1. Chromosome 17 Open Reading Frame 26 (C17orf26, Accession NM_139177) is another VGAM2499 host target gene. C17orf26 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C17orf26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf26 BINDING SITE, designated SEQ ID:29187, to the nucleotide sequence of VGAM2499 RNA, herein designated VGAM RNA, also designated SEQ ID:5210.

[84560] Another function of VGAM2499 is therefore inhibition of

Chromosome 17 Open Reading Frame 26 (C17orf26, Accession NM_139177). Accordingly, utilities of VGAM2499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf26. KIAA0416 (Accession NM_015564) is another VGAM2499 host target gene. KIAA0416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0416 BINDING SITE, designated SEQ ID:17836, to the nucleotide sequence of VGAM2499 RNA, herein designated VGAM RNA, also designated SEQ ID:5210.

[84561] Another function of VGAM2499 is therefore inhibition of KIAA0416 (Accession NM_015564). Accordingly, utilities of VGAM2499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0416. LOC255082 (Accession XM_172843) is another VGAM2499 host target gene. LOC255082 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255082, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255082 BINDING SITE, designated SEQ ID:46119, to the nucleotide sequence of VGAM2499 RNA, herein designated VGAM RNA, also designated SEQ ID:5210.

[84562] Another function of VGAM2499 is therefore inhibition of LOC255082 (Accession XM_172843). Accordingly, utilities of VGAM2499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255082. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2500 (VGAM2500) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84563] VGAM2500 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2500 was detected is described hereinabove with reference to Figs. 1-8.

[84564] VGAM2500 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2500 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[84565] VGAM2500 gene encodes a VGAM2500 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2500 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2500 precursor RNA is designated SEQ ID:2486, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2486 is located at position 173739 relative to the genome of Mouse Cytomegalovirus 1.

[84566] VGAM2500 precursor RNA folds onto itself, forming VGAM2500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84567] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2500 folded precursor RNA into VGAM2500

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2500 RNA is designated SEQ ID:5211, and is provided hereinbelow with reference to the sequence listing part.

[84568] VGAM2500 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2500 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2500 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84569] VGAM2500 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2500 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2500 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2500 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2500 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84570] The complementary binding of VGAM2500 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2500 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2500 host target RNA into VGAM2500 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[84571] It is appreciated that VGAM2500 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2500 host target genes. The mRNA of each one of this plurality of VGAM2500 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2500 RNA, herein designated VGAM RNA, and which when bound by VGAM2500 RNA causes inhibition of translation of respective one or more VGAM2500 host target proteins.

[84572] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2500 gene, herein designated VGAM GENE, on one or more VGAM2500 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84573] It is yet further appreciated that a function of VGAM2500 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2500 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2500 correlate with, and may be deduced from, the identity of the host target genes which VGAM2500 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84574] Nucleotide sequences of the VGAM2500 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2500 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2500 are further described hereinbelow with reference to Table 1.

[84575] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2500 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2500 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84576] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2500 gene, herein designated VGAM is inhibition of expression of VGAM2500 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2500 correlate with, and may be deduced from, the identity of the target genes which VGAM2500 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84577] CAAX Box 1 (CXX1, Accession NM_003928) is a VGAM2500 host target gene. CXX1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CXX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXX1 BINDING SITE, designated SEQ ID:10025, to the nucleotide sequence of VGAM2500 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5211.

[84578] A function of VGAM2500 is therefore inhibition of CAAX Box 1 (CXX1, Accession NM_003928). Accordingly, utilities of VGAM2500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXX1. Solute Carrier Family 25 (mitochondrial carrier; ornithine transporter) Member 15 (SLC25A15, Accession NM_014252) is another VGAM2500 host target gene. SLC25A15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC25A15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC25A15 BINDING SITE, designated SEQ ID:15529, to the nucleotide sequence of VGAM2500 RNA, herein designated VGAM RNA, also designated SEQ ID:5211.

[84579] Another function of VGAM2500 is therefore inhibition of Solute Carrier Family 25 (mitochondrial carrier; ornithine transporter) Member 15 (SLC25A15, Accession NM_014252), a gene which participates theornithine transport across inner mitochondrial membrane, from the cytoplasm to the matrix. Accordingly, utilities of

VGAM2500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A15. The function of SLC25A15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.DKFZP564B147 (Accession XM_088745) is another VGAM2500 host target gene. DKFZP564B147 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP564B147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564B147 BINDING SITE, designated SEQ ID:39936, to the nucleotide sequence of VGAM2500 RNA, herein designated VGAM RNA, also designated SEQ ID:5211.

[84580] Another function of VGAM2500 is therefore inhibition of DKFZP564B147 (Accession XM_088745). Accordingly, utilities of VGAM2500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564B147. KIAA1856 (Accession XM_166549) is another VGAM2500 host target gene. KIAA1856 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by KIAA1856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1856 BINDING SITE, designated SEQ ID:44527, to the nucleotide sequence of VGAM2500 RNA, herein designated VGAM RNA, also designated SEQ ID:5211.

[84581] Another function of VGAM2500 is therefore inhibition of KIAA1856 (Accession XM_166549). Accordingly, utilities of VGAM2500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1856. Serum/glucocorticoid Regulated Kinase-like (SGKL, Accession NM_013257) is another VGAM2500 host target gene. SGKL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SGKL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGKL BINDING SITE, designated SEQ ID:14928, to the nucleotide sequence of VGAM2500 RNA, herein designated VGAM RNA, also designated SEQ ID:5211.

[84582] Another function of VGAM2500 is therefore inhibition of

Serum/glucocorticoid Regulated Kinase-like (SGKL, Accession NM_013257). Accordingly, utilities of VGAM2500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGKL. LOC165246 (Accession XM_092473) is another VGAM2500 host target gene. LOC165246 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC165246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165246 BINDING SITE, designated SEQ ID:40127, to the nucleotide sequence of VGAM2500 RNA, herein designated VGAM RNA, also designated SEQ ID:5211.

[84583] Another function of VGAM2500 is therefore inhibition of LOC165246 (Accession XM_092473). Accordingly, utilities of VGAM2500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165246. LOC196337 (Accession XM_113696) is another VGAM2500 host target gene. LOC196337 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196337, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196337 BINDING SITE, designated SEQ ID:42357, to the nucleotide sequence of VGAM2500 RNA, herein designated VGAM RNA, also designated SEQ ID:5211.

[84584] Another function of VGAM2500 is therefore inhibition of LOC196337 (Accession XM_113696). Accordingly, utilities of VGAM2500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196337. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2501 (VGAM2501) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84585] VGAM2501 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2501 was detected is described hereinabove with reference to Figs. 1-8.

[84586] VGAM2501 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2501 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[84587] VGAM2501 gene encodes a VGAM2501 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2501 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2501 precursor RNA is designated SEQ ID:2487, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2487 is located at position 72060 relative to the genome of Mouse Cytomegalovirus 1.

[84588] VGAM2501 precursor RNA folds onto itself, forming VGAM2501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84589] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2501 folded precursor RNA into VGAM2501

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2501 RNA is designated SEQ ID:5212, and is provided hereinbelow with reference to the sequence listing part.

[84590] VGAM2501 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2501 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2501 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84591] VGAM2501 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2501 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2501 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2501 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2501 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84592] The complementary binding of VGAM2501 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2501 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2501 host target RNA into VGAM2501 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[84593] It is appreciated that VGAM2501 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2501 host target genes. The mRNA of each one of this plurality of VGAM2501 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2501 RNA, herein designated VGAM RNA, and which when bound by VGAM2501 RNA causes inhibition of translation of respective one or more VGAM2501 host target proteins.

[84594] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2501 gene, herein designated VGAM GENE, on one or more VGAM2501 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84595] It is yet further appreciated that a function of VGAM2501 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2501 correlate with, and may be deduced from, the identity of the host target genes which VGAM2501 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84596] Nucleotide sequences of the VGAM2501 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2501 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2501 are further described hereinbelow with reference to Table 1.

[84597] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2501 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2501 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84598] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2501 gene, herein designated VGAM is inhibition of expression of VGAM2501 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2501 correlate with, and may be deduced from, the identity of the target genes which VGAM2501 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84599] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM_004776) is a VGAM2501 host target gene. B4GALT5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by B4GALT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT5 BINDING SITE, designated SEQ ID:11168, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM

RNA, also designated SEQ ID:5212.

[84600] A function of VGAM2501 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM_004776). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT5. Growth Factor Receptor-bound Protein 10 (GRB10, Accession NM_005311) is another VGAM2501 host target gene. GRB10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GRB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRB10 BINDING SITE, designated SEQ ID:11787, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84601] Another function of VGAM2501 is therefore inhibition of Growth Factor Receptor-bound Protein 10 (GRB10, Accession NM_005311), a gene which plays a functional role in insulin and IGF-I signaling. Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRB10.

The function of GRB10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM441.LIM Domain Binding 2 (LDB2, Accession NM_001290) is another VGAM2501 host target gene. LDB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LDB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDB2 BINDING SITE, designated SEQ ID:6970, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84602] Another function of VGAM2501 is therefore inhibition of LIM Domain Binding 2 (LDB2, Accession NM_001290), a gene which physically interacts with the LIM domains of nuclear proteins. Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDB2. The function of LDB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2325.Pregnancy-associated Plasma Protein A

(PAPPA, Accession NM_002581) is another VGAM2501 host target gene. PAPPA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PAPPA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAPPA BINDING SITE, designated SEQ ID:8442, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84603] Another function of VGAM2501 is therefore inhibition of Pregnancy-associated Plasma Protein A (PAPPA, Accession NM_002581), a gene which is a putative metalloprotease. Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAPPA. The function of PAPPA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1324.Protocadherin 11 X-linked (PCDH11X, Accession NM_032968) is another VGAM2501 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions

of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26791 and SEQ ID:26806 respectively, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84604] Another function of VGAM2501 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.Retina and Anterior Neural Fold Homeobox (RAX, Accession NM_013435) is another VGAM2501 host target gene. RAX BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by RAX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAX BINDING SITE, designated SEQ ID:15093, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84605] Another function of VGAM2501 is therefore inhibition of Retina and Anterior Neural Fold Homeobox (RAX, Accession NM_013435), a gene which activates PKR in a dsRNA-independent manner. Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAX. The function of RAX has been established by previous studies. The double-stranded RNA (dsRNA)-activated protein kinase PKR (OMIM Ref. No. 176871) is a mediator of the effects of interferon (see OMIM Ref. No. 107470), particularly its antiviral activities. PKR has also been implicated in the onset of differentiation. Based on its interaction with PKR, Patel and Sen (1998) cloned PACT cDNA. The PACT cDNA encodes a deduced 313-amino acid polypeptide that contains 3 motifs resembling the dimerization motifs present in PKR and other dsRNA-binding proteins. Northern blot

analysis revealed that PACT is expressed as a 2.0-kb mRNA in a variety of human cell lines. Ito et al. (1999) cloned the mouse homolog, which they called RAX, from a mouse Il3 (OMIM Ref. No. 147740)-dependent cell cDNA library using the yeast 2-hybrid interactive cloning system. They showed that the mouse and human sequences share 98% identity. Northern blot analysis detected expression of RAX in all tissues tested. Western blot analysis showed a 35-kD protein expressed in cell lines derived from several mammalian species.

[84606] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[84607] Patel, R. C.; Sen, G. C. : PACT, a protein activator of the interferon-induced protein kinase, PKR. EMBO J. 17: 4379-4390, 1998. ; and

[84608] Ito, T.; Yang, M.; May, W. S. : RAX, a cellular activator for double-stranded RNA-dependent protein kinase during stress signaling. J. Biol. Chem. 274: 15427-15432, 1999.

[84609] Further studies establishing the function and utilities of RAX are found in John Hopkins OMIM database record ID 603424, and in sited publications numbered 8188-8190 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference.Short Stature Homeobox (SHOX, Accession NM_000451) is another VGAM2501 host target gene. SHOX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SHOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHOX BINDING SITE, designated SEQ ID:6056, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84610] Another function of VGAM2501 is therefore inhibition of Short Stature Homeobox (SHOX, Accession NM_000451). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHOX. Solute Carrier Family 6 (neurotransmitter transporter, dopamine), Member 3 (SLC6A3, Accession NM_001044) is another VGAM2501 host target gene. SLC6A3 BINDING SITE1 through SLC6A3 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC6A3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of SLC6A3 BINDING SITE1 through SLC6A3 BINDING SITE5, designated SEQ ID:6710, SEQ ID:6709, SEQ ID:6708, SEQ ID:6711 and SEQ ID:6707 respectively, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84611] Another function of VGAM2501 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, dopamine), Member 3 (SLC6A3, Accession NM_001044), a gene which terminates the action of dopamine by its high affinity sodium-dependent reuptake into presynaptic terminals. Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A3. The function of SLC6A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1753.Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575) is another VGAM2501 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:19005, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84612] Another function of VGAM2501 is therefore inhibition of Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31. Frequently Rearranged In Advanced T-cell Lymphomas (FRAT1, Accession NM_005479) is another VGAM2501 host target gene. FRAT1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FRAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRAT1 BINDING SITE, designated SEQ ID:11981, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84613] Another function of VGAM2501 is therefore inhibition of Frequently Rearranged In Advanced T-cell Lymphomas

(FRAT1, Accession NM_005479). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRAT1. KIAA0153 (Accession NM_015140) is another VGAM2501 host target gene. KIAA0153 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0153 BINDING SITE, designated SEQ ID:17499, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84614] Another function of VGAM2501 is therefore inhibition of KIAA0153 (Accession NM_015140). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0153. KIAA0469 (Accession NM_014851) is another VGAM2501 host target gene. KIAA0469 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:16894, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84615] Another function of VGAM2501 is therefore inhibition of KIAA0469 (Accession NM_014851). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469. KIAA1363 (Accession XM_045056) is another VGAM2501 host target gene. KIAA1363 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1363 BINDING SITE, designated SEQ ID:34334, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84616] Another function of VGAM2501 is therefore inhibition of KIAA1363 (Accession XM_045056). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1363. KIAA1951 (Accession XM_057401) is another

VGAM2501 host target gene. KIAA1951 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1951 BINDING SITE, designated SEQ ID:36512, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84617] Another function of VGAM2501 is therefore inhibition of KIAA1951 (Accession XM_057401). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1951. Paternally Expressed 10 (PEG10, Accession NM_015068) is another VGAM2501 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:17430, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ

ID:5212.

[84618] Another function of VGAM2501 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM_015068). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. LOC128989 (Accession XM_059310) is another VGAM2501 host target gene. LOC128989 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC128989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128989 BINDING SITE, designated SEQ ID:36944, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84619] Another function of VGAM2501 is therefore inhibition of LOC128989 (Accession XM_059310). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128989. LOC137964 (Accession XM_059933) is another VGAM2501 host target gene. LOC137964 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC137964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC137964 BINDING SITE, designated SEQ ID:37112, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84620] Another function of VGAM2501 is therefore inhibition of LOC137964 (Accession XM_059933). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137964. LOC148397 (Accession XM_086171) is another VGAM2501 host target gene. LOC148397 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148397 BINDING SITE, designated SEQ ID:38529, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84621] Another function of VGAM2501 is therefore inhibition of LOC148397 (Accession XM_086171). Accordingly, utilities

of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148397. LOC149127 (Accession XM_097584) is another VGAM2501 host target gene. LOC149127 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149127 BINDING SITE, designated SEQ ID:40948, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84622] Another function of VGAM2501 is therefore inhibition of LOC149127 (Accession XM_097584). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149127. LOC152860 (Accession XM_087539) is another VGAM2501 host target gene. LOC152860 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC152860 BINDING SITE, designated SEQ ID:39324, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84623] Another function of VGAM2501 is therefore inhibition of LOC152860 (Accession XM_087539). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152860. LOC197408 (Accession XM_117031) is another VGAM2501 host target gene. LOC197408 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197408 BINDING SITE, designated SEQ ID:43207, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84624] Another function of VGAM2501 is therefore inhibition of LOC197408 (Accession XM_117031). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197408. LOC205095 (Accession XM_119820) is another VGAM2501 host target gene. LOC205095 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC205095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205095 BINDING SITE, designated SEQ ID:43604, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84625] Another function of VGAM2501 is therefore inhibition of LOC205095 (Accession XM_119820). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205095. LOC219688 (Accession XM_167568) is another VGAM2501 host target gene. LOC219688 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219688 BINDING SITE, designated SEQ ID:44700, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84626] Another function of VGAM2501 is therefore inhibition of

LOC219688 (Accession XM_167568). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219688. LOC253897 (Accession XM_171187) is another VGAM2501 host target gene. LOC253897 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253897, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253897 BINDING SITE, designated SEQ ID:45968, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84627] Another function of VGAM2501 is therefore inhibition of LOC253897 (Accession XM_171187). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253897. LOC255423 (Accession XM_174498) is another VGAM2501 host target gene. LOC255423 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC255423 BINDING SITE, designated SEQ ID:46594, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84628] Another function of VGAM2501 is therefore inhibition of LOC255423 (Accession XM_174498). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255423. LOC256222 (Accession XM_173177) is another VGAM2501 host target gene. LOC256222 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256222 BINDING SITE, designated SEQ ID:46427, to the nucleotide sequence of VGAM2501 RNA, herein designated VGAM RNA, also designated SEQ ID:5212.

[84629] Another function of VGAM2501 is therefore inhibition of LOC256222 (Accession XM_173177). Accordingly, utilities of VGAM2501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256222. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2502 (VGAM2502) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84630] VGAM2502 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2502 was detected is described hereinabove with reference to Figs. 1-8.

[84631] VGAM2502 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2502 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84632] VGAM2502 gene encodes a VGAM2502 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2502 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2502 precursor RNA is designated SEQ ID:2488, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2488 is located at position 192021 relative to the genome of Mouse Cytomegalovirus 1.

[84633] VGAM2502 precursor RNA folds onto itself, forming VGAM2502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84634] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2502 folded precursor RNA into VGAM2502 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2502 RNA is designated SEQ ID:5213, and is provided hereinbelow with reference to the sequence listing part.

[84635] VGAM2502 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2502 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2502 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84636] VGAM2502 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2502 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2502 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2502 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2502 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84637] The complementary binding of VGAM2502 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2502 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2502 host target RNA into VGAM2502 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84638] It is appreciated that VGAM2502 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2502 host target genes. The mRNA of each one of this plurality of VGAM2502 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2502 RNA, herein designated VGAM RNA, and which when bound by VGAM2502 RNA causes inhibition of translation of respective one or more

VGAM2502 host target proteins.

[84639] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2502 gene, herein designated VGAM GENE, on one or more VGAM2502 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84640] It is yet further appreciated that a function of VGAM2502 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2502 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1.

Specific functions, and accordingly utilities, of VGAM2502 correlate with, and may be deduced from, the identity of the host target genes which VGAM2502 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84641] Nucleotide sequences of the VGAM2502 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2502 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2502 are further described hereinbelow with reference to Table 1.

[84642] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2502 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2502 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84643] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2502 gene, herein designated VGAM is inhibition of expression of VGAM2502 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2502 correlate with, and may be deduced from, the identity of the target genes which VGAM2502 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84644] Dual Specificity Phosphatase 7 (DUSP7, Accession XM_037430) is a VGAM2502 host target gene. DUSP7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DUSP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP7 BINDING SITE, designated SEQ ID:32614, to the nucleotide sequence of VGAM2502 RNA, herein designated VGAM RNA, also designated SEQ ID:5213.

[84645] A function of VGAM2502 is therefore inhibition of Dual Specificity Phosphatase 7 (DUSP7, Accession XM_037430), a gene which is a member of the dual specificity protein phosphatase family . Accordingly, utilities of VGAM2502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP7. The function of DUSP7 has been established by previous studies. Members of the mitogen-activated protein (MAP) kinase family play a pivotal role in cellular signal transduction.

The dual-specificity phosphatases can reverse MAP kinase activation by dephosphorylating critical phosphotyrosine and phosphothreonine residues. Muda et al. (1996) identified rat superior cervical ganglion cDNAs encoding 2 dual-specificity phosphatases that they designated MKP3 (OMIM Ref. No. 602748) and MKPX. The predicted 280-amino acid sequence of the partial MKPX cDNA was 76% identical to that of MKP3. Groom et al. (1996) identified cDNAs encoding the human MKP3 and MKPX homologs, which they called PYST1 and PYST2, respectively. The predicted amino acid sequence of the partial PYST2 cDNA was 73% identical to that of PYST1. Northern analysis revealed that the 3.5-kb PYST2 mRNA was expressed at low levels in several tissues. In liver, Groom et al. (1996) observed strong expression of a 2.5-kb transcript and much weaker expression of a 5-kb transcript.

[84646] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[84647] Groom, L. A.; Sneddon, A. A.; Alessi, D. R.; Dowd, S.; Keyse, S. M. : Differential regulation of the MAP, SAP and Rk/p38 kinases by Pyst1, a novel cytosolic dual-specificity phosphatase. EMBO J. 15: 3621-3632, 1996. ; and

[84648] Muda, M.; Boschert, U.; Dickinson, R.; Martinou, J.-C.; Martinou, I.; Camps, M.; Schlegel, W.; Arkinstall, S. : MKP-3, a novel cytosolic protein-tyrosine phosphatase that exemplifies a.

[84649] Further studies establishing the function and utilities of DUSP7 are found in John Hopkins OMIM database record ID 602749, and in sited publications numbered 2411-2413 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM_005935) is another VGAM2502 host target gene. MLLT2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MLLT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT2 BINDING SITE, designated SEQ ID:12567, to the nucleotide sequence of VGAM2502 RNA, herein designated VGAM RNA, also designated SEQ ID:5213.

[84650] Another function of VGAM2502 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax

homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM_005935), a gene which is a Putative transcription factor. Accordingly, utilities of VGAM2502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT2. The function of MLLT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57.FLJ12132 (Accession NM_024980) is another VGAM2502 host target gene. FLJ12132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12132 BINDING SITE, designated SEQ ID:24541, to the nucleotide sequence of VGAM2502 RNA, herein designated VGAM RNA, also designated SEQ ID:5213.

[84651] Another function of VGAM2502 is therefore inhibition of FLJ12132 (Accession NM_024980). Accordingly, utilities of VGAM2502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12132. FLJ20306 (Accession NM_017756) is another

VGAM2502 host target gene. FLJ20306 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20306 BINDING SITE, designated SEQ ID:19367, to the nucleotide sequence of VGAM2502 RNA, herein designated VGAM RNA, also designated SEQ ID:5213.

[84652] Another function of VGAM2502 is therefore inhibition of FLJ20306 (Accession NM_017756). Accordingly, utilities of VGAM2502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20306. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2503 (VGAM2503) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84653] VGAM2503 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2503 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[84654] VGAM2503 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2503 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84655] VGAM2503 gene encodes a VGAM2503 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2503 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2503 precursor RNA is designated SEQ ID:2489, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2489 is located at position 125983 relative to the genome of Mouse Cytomegalovirus 1.

[84656] VGAM2503 precursor RNA folds onto itself, forming VGAM2503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84657] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2503 folded precursor RNA into VGAM2503 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2503 RNA is designated SEQ ID:5214, and is provided hereinbelow with reference to the sequence listing part.

[84658] VGAM2503 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2503 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2503 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84659] VGAM2503 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2503 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2503 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2503 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2503 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84660] The complementary binding of VGAM2503 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2503 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2503 host target RNA into VGAM2503 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84661] It is appreciated that VGAM2503 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2503 host target genes. The mRNA of each one of this plurality of VGAM2503 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2503 RNA, herein designated VGAM RNA, and which when bound by VGAM2503 RNA causes inhibition of translation of respective one or more VGAM2503 host target proteins.

[84662] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2503 gene, herein designated VGAM GENE, on one or more VGAM2503 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84663] It is yet further appreciated that a function of VGAM2503 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2503 correlate with, and may be deduced from, the identity of the host target genes which VGAM2503 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84664] Nucleotide sequences of the VGAM2503 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2503 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2503 are further described hereinbelow with reference to Table 1.

[84665] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2503 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2503 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84666] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2503 gene, herein designated VGAM is inhibition of expression of VGAM2503 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2503 correlate with, and may be deduced from, the identity of the target genes which VGAM2503 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84667] Carboxyl Ester Lipase-like (bile salt-stimulated lipase-like) (CELL, Accession NM_001808) is a VGAM2503 host target gene. CELL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CELL, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELL BINDING SITE, designated SEQ ID:7558, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84668] A function of VGAM2503 is therefore inhibition of Carboxyl Ester Lipase-like (bile salt-stimulated lipase-like) (CELL, Accession NM_001808), a gene which is a Carboxyl ester lipase-like protein. Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELL. The function of CELL has been established by previous studies. The human lactating mammary gland and pancreas produce a lipolytic enzyme, carboxyl ester lipase (CEL; 114840), earlier called bile salt-stimulated lipase. The enzyme exerts its function in duodenal juice, is activated when mixed with bile salts, and plays an important role in the digestion of milk fat in newborn infants. Lidberg et al. (1992) described the genomic organization of the CEL gene and proposed the presence of a transcribed pseudogene, designated carboxyl ester lipase-like gene (CELL). The existence of the CELL gene was confirmed by Kumar et al. (1992). The main difference between CEL and

CELL is that the latter lacks a 4.8-kb fragment, including exons 2-7. Furthermore, in the coding sequence, several differences are found in exons 10 and 11. The remaining coding regions are identical in the 2 genes. The intron sequences of the genes show a 97.5% homology. The CELL gene does not include exon 5, in which the active serine is located, indicating that the product of this gene cannot be a lipase. Nilsson et al. (1993) found that in contrast to the CEL gene, CELL is expressed in low amounts in all tissues analyzed. They found that the average length of the cDNA for CELL is 1,214 bases. This sequence includes several termination codons in all 3 reading frames. The longest open reading frame with the same start of translation as that of the CEL transcript could encode a 59-amino acid-long peptide, presumably without any function. The CELL gene may have arisen as a result of gene duplication of the CEL gene followed by deletions and point mutations. A hypervariable region was characterized in the last exon of the CELL gene. Nilsson et al. (1993) suggested that this polymorphism would be useful for linkage analysis. Taylor et al. (1991) suggested that the CEL gene contains a hypervariable region, according to results obtained by Southern blotting. Most processed pseudogenes (Vanin,

1985) are transcriptionally silent; transcribed pseudogenes are rare because once the coding information of a particular gene is inactivated by a mutational event, further mutation of promoter sequences would not be selected against. Two known pseudogenes that retained their ability to be transcribed are the high-affinity dopamine receptor pseudogene (Weinshank et al., 1991) and the murine glyceraldhyde-3-phosphate dehydrogenase pseudogene (Galland et al., 1990). These genes may have arisen through gene duplication followed by several mutations. Thus, even though these genes are expressed, they will not give rise to functional protein. Nilsson et al. (1993) stated that 'the CEL gene and the CELL gene were mapped to the same region of chromosome 9,' namely, 9q34.3.

[84669] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[84670] Lidberg, U.; Nilsson, J.; Stromberg, K.; Stenman, G.; Sahlin, P.; Enerback, S.; Bjursell, G. : Genomic organization, sequence analysis, and chromosomal localization of the human carboxyl ester lipase (CEL) gene and a CEL-like (CELL) gene. Genomics 13: 630-640, 1992. ; and

[84671] Lidmer, A.-S.; Kannius, M.; Lundberg, L.; Bjursell, G.; Nilsson, J. : Molecular cloning and characterization of the mouse carboxyl ester lipase gene and evidence for expression in the l.

[84672] Further studies establishing the function and utilities of CELL are found in John Hopkins OMIM database record ID 114841, and in sited publications numbered 4230-4229, 4231-423 and 2037 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Lamin A/C (LMNA, Accession NM_005572) is another VGAM2503 host target gene. LMNA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LMNA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMNA BINDING SITE, designated SEQ ID:12099, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84673] Another function of VGAM2503 is therefore inhibition of Lamin A/C (LMNA, Accession NM_005572), a gene which is thought to provide a framework for the nuclear envelope and may also interact with chromatin. Accordingly,

utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMNA. The function of LMNA has been established by previous studies. The nuclear lamina is a proteinaceous layer apposed to the inner nuclear membrane. It is composed of a family of polypeptides, the lamins, highly conserved in evolution (Krohne and Benavente, 1986). In mammals, 3 lamins, A, B, and C, have been described, with molecular weights ranging from 60,000 to 78,000. Lamins A and C but not lamin B have close sequence homology. During mitosis, the lamina meshwork is reversibly disassembled in parallel with phosphorylation of the lamins. Lamins can be classified with the intermediate filament (IF) polypeptides. Guilly et al. (1987) demonstrated that lamin B was the only lamin present in T lymphoblasts. The mRNAs of lamins A and C were detected in HeLa cells. The transport of newly-synthesized proteins from the cytoplasm into the nucleus differs from the transport of proteins into other organelles such as mitochondria by 1 important feature: sequences are not cleaved but remain a permanent feature of the mature polypeptide. One exception to this rule, however, appears to be lamin A. Lebel and Raymond (1987) concluded that

lamin A is not synthesized as a large precursor polypeptide Complementary DNA cloning and sequencing showed that human lamins A and C are identical for the first 566 amino acids (McKeon et al., 1986; Fisher et al., 1986). Pre-lamin A, from which the last 18 amino acids are proteolytically removed to yield lamin A, has 98 unique carboxy-terminal amino acids. Lamin C has 6 unique carboxy-terminal amino acids. Because pre-lamin A contains a CAAX (cysteine-aliphatic-aliphatic-any amino acid) box at its carboxyl terminus, it can be modified by farnesylation, whereas lamin C cannot. The sequence similarities and data obtained from Southern blotting (McKeon et al., 1986) suggested that lamin A and lamin C arise from 1 gene by alternative splicing. Lin and Worman (1993) demonstrated that the coding region of the lamin A/C gene spans approximately 24 kb and contains 12 exons. Alternative splicing within exon 10 gives rise to 2 different mRNAs that code for pre-lamin A and lamin C

[84674] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[84675] Lebel, S.; Raymond, Y. : Lamin A is not synthesized as a larger precursor polypeptide. Biochem. Biophys. Res.

Commun. 149: 417-423, 1987. ; and

[84676] Lin, F.; Worman, H. J. : Structural organization of the human gene encoding nuclear lamin A and nuclear lamin C. J. Biol. Chem. 268: 16321-16326, 1993.

[84677] Further studies establishing the function and utilities of LMNA are found in John Hopkins OMIM database record ID 150330, and in sited publications numbered 3843, 12466-1248 and 12699 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.NHP2 Non-histone Chromosome Protein 2-like 1 (S. cerevisiae) (NHP2L1, Accession NM_005008) is another VGAM2503 host target gene. NHP2L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NHP2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NHP2L1 BINDING SITE, designated SEQ ID:11444, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84678] Another function of VGAM2503 is therefore inhibition of NHP2 Non-histone Chromosome Protein 2-like 1 (S. cerevisiae) (NHP2L1, Accession NM_005008), a gene which

may play a role in the late stage of spliceosome assembly. Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NHP2L1. The function of NHP2L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1923.RAN Binding Protein 3 (RANBP3, Accession NM_003624) is another VGAM2503 host target gene. RANBP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RANBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RANBP3 BINDING SITE, designated SEQ ID:9689, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84679] Another function of VGAM2503 is therefore inhibition of RAN Binding Protein 3 (RANBP3, Accession NM_003624). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP3. Usher Syndrome 3A (USH3A, Accession NM_052995) is another VGAM2503

host target gene. USH3A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by USH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USH3A BINDING SITE, designated SEQ ID:27564, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84680] Another function of VGAM2503 is therefore inhibition of Usher Syndrome 3A (USH3A, Accession NM_052995). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USH3A. Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM_024331) is another VGAM2503 host target gene. C20orf121 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C20orf121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf121 BINDING SITE, designated SEQ ID:23634, to the nucleotide sequence of VGAM2503 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5214.

[84681] Another function of VGAM2503 is therefore inhibition of Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM_024331). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf121. DKFZP434K028 (Accession XM_167745) is another VGAM2503 host target gene. DKFZP434K028 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434K028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K028 BINDING SITE, designated SEQ ID:44772, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84682] Another function of VGAM2503 is therefore inhibition of DKFZP434K028 (Accession XM_167745). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434K028. FLJ10847 (Accession NM_018242) is another VGAM2503 host target gene. FLJ10847 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10847, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10847 BINDING SITE, designated SEQ ID:20202, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84683] Another function of VGAM2503 is therefore inhibition of FLJ10847 (Accession NM_018242). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10847. FLJ13490 (Accession NM_024942) is another VGAM2503 host target gene. FLJ13490 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13490 BINDING SITE, designated SEQ ID:24487, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84684] Another function of VGAM2503 is therefore inhibition of

FLJ13490 (Accession NM_024942). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13490. MDS006 (Accession NM_020233) is another VGAM2503 host target gene. MDS006 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MDS006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDS006 BINDING SITE, designated SEQ ID:21503, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84685] Another function of VGAM2503 is therefore inhibition of MDS006 (Accession NM_020233). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDS006. MGC15873 (Accession NM_032920) is another VGAM2503 host target gene. MGC15873 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC15873, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC15873 BINDING SITE, designated SEQ ID:26743, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84686] Another function of VGAM2503 is therefore inhibition of MGC15873 (Accession NM_032920). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15873. SCAM-1 (Accession NM_005775) is another VGAM2503 host target gene. SCAM-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCAM-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAM-1 BINDING SITE, designated SEQ ID:12351, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84687] Another function of VGAM2503 is therefore inhibition of SCAM-1 (Accession NM_005775). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAM-1. SMOC2 (Accession XM_051452) is another VGAM2503

host target gene. SMOC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMOC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMOC2 BINDING SITE, designated SEQ ID:35837, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84688] Another function of VGAM2503 is therefore inhibition of SMOC2 (Accession XM_051452). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOC2. Tousled-like Kinase 2 (TLK2, Accession XM_085650) is another VGAM2503 host target gene. TLK2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TLK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLK2 BINDING SITE, designated SEQ ID:38275, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84689] Another function of VGAM2503 is therefore inhibition of Tousled-like Kinase 2 (TLK2, Accession XM_085650). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLK2. LOC144587 (Accession XM_040195) is another VGAM2503 host target gene. LOC144587 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144587, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144587 BINDING SITE, designated SEQ ID:33270, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84690] Another function of VGAM2503 is therefore inhibition of LOC144587 (Accession XM_040195). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144587. LOC146802 (Accession XM_085595) is another VGAM2503 host target gene. LOC146802 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146802, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146802 BINDING SITE, designated SEQ ID:38247, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84691] Another function of VGAM2503 is therefore inhibition of LOC146802 (Accession XM_085595). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146802. LOC147841 (Accession XM_085924) is another VGAM2503 host target gene. LOC147841 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147841 BINDING SITE, designated SEQ ID:38398, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84692] Another function of VGAM2503 is therefore inhibition of LOC147841 (Accession XM_085924). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC147841. LOC202986 (Accession XM_117489) is another VGAM2503 host target gene. LOC202986 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202986 BINDING SITE, designated SEQ ID:43471, to the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84693] Another function of VGAM2503 is therefore inhibition of LOC202986 (Accession XM_117489). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202986. LOC221474 (Accession XM_166464) is another VGAM2503 host target gene. LOC221474 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221474 BINDING SITE, designated SEQ ID:44377, to

the nucleotide sequence of VGAM2503 RNA, herein designated VGAM RNA, also designated SEQ ID:5214.

[84694] Another function of VGAM2503 is therefore inhibition of LOC221474 (Accession XM_166464). Accordingly, utilities of VGAM2503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221474. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2504 (VGAM2504) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84695] VGAM2504 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2504 was detected is described hereinabove with reference to Figs. 1-8.

[84696] VGAM2504 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2504 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84697] VGAM2504 gene encodes a VGAM2504 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2504 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2504 precursor RNA is designated SEQ ID:2490, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2490 is located at position 179418 relative to the genome of Mouse Cytomegalovirus 1.

[84698] VGAM2504 precursor RNA folds onto itself, forming VGAM2504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84699] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2504 folded precursor RNA into VGAM2504 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2504 RNA is designated SEQ ID:5215, and is provided hereinbelow with reference to the sequence listing part.

[84700] VGAM2504 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2504 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2504 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84701] VGAM2504 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2504 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2504 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2504 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2504 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84702] The complementary binding of VGAM2504 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2504 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2504 host target RNA into VGAM2504 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84703] It is appreciated that VGAM2504 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2504 host target genes. The mRNA of each one of this plurality of VGAM2504 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2504 RNA, herein designated VGAM RNA, and which when bound by VGAM2504 RNA causes inhibition of translation of respective one or more VGAM2504 host target proteins.

[84704] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2504 gene, herein designated VGAM GENE, on one or more VGAM2504 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84705] It is yet further appreciated that a function of VGAM2504 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2504 correlate with, and may be deduced from, the identity of the host target genes which VGAM2504 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84706] Nucleotide sequences of the VGAM2504 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2504 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2504 are further described hereinbelow with reference to Table 1.

[84707] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2504 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2504 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84708] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2504 gene, herein designated VGAM is inhibition of expression of VGAM2504 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2504 correlate with, and may be deduced from, the identity of the target genes which VGAM2504 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84709] ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052) is a VGAM2504 host target gene. ATP7A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE, designated SEQ ID:5500, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84710] A function of VGAM2504 is therefore inhibition of ATPase,

Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A. Dipeptidylpeptidase VI (DPP6, Accession NM_130797) is another VGAM2504 host target gene. DPP6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DPP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPP6 BINDING SITE, designated SEQ ID:28283, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84711] Another function of VGAM2504 is therefore inhibition of Dipeptidylpeptidase VI (DPP6, Accession NM_130797), a gene which may be involved in the physiological processes of brain function. Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPP6. The function of DPP6 has been established by previous studies. Wada et al. (1992) isolated cDNA clones for a dipeptidyl peptidase IV-related protein from bovine and

rat brain libraries. Unlike dipeptidyl peptidase IV (OMIM Ref. No. 102720) which belongs to a family in which a serine, an aspartate, and a histidine form a catalytic triad, the DPPIV-related protein does not show the first serine residue. Yokotani et al. (1993) isolated the human homolog. Using a fragment of the bovine DPPX clone as a probe, Yokotani et al. (1993) mapped the human DPP6 gene to chromosome 7 by PCR analysis of somatic cell hybrids. Wada et al. (1993) showed that the mouse Dpp6 gene is linked to markers in the proximal end of chromosome 5 in a region of conserved synteny.

[84712] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[84713] Wada, K.; Yokotani, N.; Hunter, C.; Doi, K.; Wenthold, R. J.; Shimasaki, S. : Differential expression of two distinct forms of mRNA encoding members of a dipeptidyl aminopeptidase family. Proc. Nat. Acad. Sci. 89: 197-201, 1992. ; and

[84714] Yokotani, N.; Doi, K.; Wenthold, R. J.; Wada, K. : Non-conservation of a catalytic residue in a depeptidyl aminopeptidase IV-related protein encoded by a gene on human chromosome 7. Hum.

[84715] Further studies establishing the function and utilities of DPP6 are found in John Hopkins OMIM database record ID 126141, and in sited publications numbered 4320-4322 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.EphA8 (EPHA8, Accession NM_020526) is another VGAM2504 host target gene. EPHA8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA8 BINDING SITE, designated SEQ ID:21748, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84716] Another function of VGAM2504 is therefore inhibition of EphA8 (EPHA8, Accession NM_020526), a gene which Eph-related receptor tyrosine kinase A8. Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA8. The function of EPHA8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM494.Huntingtin (Huntington disease) (HD, Accession NM_002111) is another VGAM2504 host target gene. HD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:7890, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84717] Another function of VGAM2504 is therefore inhibition of Huntingtin (Huntington disease) (HD, Accession NM_002111). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD. MAX Interacting Protein 1 (MXI1, Accession NM_005962) is another VGAM2504 host target gene. MXI1 BINDING SITE1 and MXI1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MXI1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MXI1

BINDING SITE1 and MXI1 BINDING SITE2, designated SEQ ID:12583 and SEQ ID:28193 respectively, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84718] Another function of VGAM2504 is therefore inhibition of MAX Interacting Protein 1 (MXI1, Accession NM_005962), a gene which acts as a tumor suppressor in vivo, engages the MYC network in a functionally relevant manner. Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MXI1. The function of MXI1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128.ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM_031949) is another VGAM2504 host target gene. ACTR1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACTR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTR1A BINDING SITE, designated SEQ ID:31530, to the nucleotide sequence of VGAM2504 RNA,

herein designated VGAM RNA, also designated SEQ ID:5215.

[84719] Another function of VGAM2504 is therefore inhibition of ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM_031949). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR1A. Chemokine (C-C motif) Receptor 8 (CCR8, Accession NM_005201) is another VGAM2504 host target gene. CCR8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR8 BINDING SITE, designated SEQ ID:11701, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84720] Another function of VGAM2504 is therefore inhibition of Chemokine (C-C motif) Receptor 8 (CCR8, Accession NM_005201). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR8. CIZ1 (Accession NM_012127) is another VGAM2504 host target gene. CIZ1

BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CIZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIZ1 BINDING SITE, designated SEQ ID:14442, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84721] Another function of VGAM2504 is therefore inhibition of CIZ1 (Accession NM_012127). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIZ1. Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259) is another VGAM2504 host target gene. DOCK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DOCK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK3 BINDING SITE, designated SEQ ID:33040, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84722] Another function of VGAM2504 is therefore inhibition of Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK3. KIAA0894 (Accession NM_014896) is another VGAM2504 host target gene. KIAA0894 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0894 BINDING SITE, designated SEQ ID:17053, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84723] Another function of VGAM2504 is therefore inhibition of KIAA0894 (Accession NM_014896). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0894. KIAA1364 (Accession XM_032997) is another VGAM2504 host target gene. KIAA1364 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1364, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1364 BINDING SITE, designated SEQ ID:31811, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84724] Another function of VGAM2504 is therefore inhibition of KIAA1364 (Accession XM_032997). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1364. KIAA1416 (Accession XM_098762) is another VGAM2504 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41809, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84725] Another function of VGAM2504 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1416. MGC21675 (Accession NM_052861) is another VGAM2504 host target gene. MGC21675 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC21675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21675 BINDING SITE, designated SEQ ID:27445, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84726] Another function of VGAM2504 is therefore inhibition of MGC21675 (Accession NM_052861). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21675. PIPPIN (Accession XM_086825) is another VGAM2504 host target gene. PIPPIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIPPIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIPPIN BINDING SITE, designated SEQ ID:38910, to the nucleotide sequence of

VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84727] Another function of VGAM2504 is therefore inhibition of PIPPIN (Accession XM_086825). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIPPIN. LOC150685 (Accession XM_103563) is another VGAM2504 host target gene. LOC150685 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150685, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150685 BINDING SITE, designated SEQ ID:42154, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84728] Another function of VGAM2504 is therefore inhibition of LOC150685 (Accession XM_103563). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150685. LOC201522 (Accession XM_113978) is another VGAM2504 host target gene. LOC201522 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC201522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201522 BINDING SITE, designated SEQ ID:42584, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84729] Another function of VGAM2504 is therefore inhibition of LOC201522 (Accession XM_113978). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201522. LOC221398 (Accession XM_165762) is another VGAM2504 host target gene. LOC221398 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221398, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221398 BINDING SITE, designated SEQ ID:43748, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84730] Another function of VGAM2504 is therefore inhibition of LOC221398 (Accession XM_165762). Accordingly, utilities

of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221398. LOC256250 (Accession XM_173171) is another VGAM2504 host target gene. LOC256250 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256250, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256250 BINDING SITE, designated SEQ ID:46424, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84731] Another function of VGAM2504 is therefore inhibition of LOC256250 (Accession XM_173171). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256250. LOC91040 (Accession XM_035641) is another VGAM2504 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91040 BINDING SITE, designated SEQ ID:32313, to the nucleotide sequence of VGAM2504 RNA, herein designated VGAM RNA, also designated SEQ ID:5215.

[84732] Another function of VGAM2504 is therefore inhibition of LOC91040 (Accession XM_035641). Accordingly, utilities of VGAM2504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2505 (VGAM2505) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[84733] VGAM2505 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2505 was detected is described hereinabove with reference to Figs. 1-8.

[84734] VGAM2505 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse Cytomegalovirus 1. VGAM2505 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[84735] VGAM2505 gene encodes a VGAM2505 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2505 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2505 precursor RNA is designated SEQ ID:2491, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2491 is located at position 75695 relative to the genome of Mouse Cytomegalovirus 1.

[84736] VGAM2505 precursor RNA folds onto itself, forming VGAM2505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[84737] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2505 folded precursor RNA into VGAM2505 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2505 RNA is designated SEQ ID:5216, and is provided hereinbelow with reference to the sequence listing part.

[84738] VGAM2505 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2505 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2505 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[84739] VGAM2505 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2505 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2505 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2505 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2505 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[84740] The complementary binding of VGAM2505 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2505 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2505 host target RNA into VGAM2505 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[84741] It is appreciated that VGAM2505 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2505 host target genes. The mRNA of each one of this plurality of VGAM2505 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2505 RNA, herein designated VGAM RNA, and which when bound by VGAM2505 RNA causes inhibition of translation of respective one or more VGAM2505 host target proteins.

[84742] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2505 gene, herein designated VGAM GENE, on one or more VGAM2505 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[84743] It is yet further appreciated that a function of VGAM2505 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of viral infection by Mouse Cytomegalovirus 1. Specific functions, and accordingly utilities, of VGAM2505 correlate with, and may be deduced from, the identity of the host target genes which VGAM2505 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[84744] Nucleotide sequences of the VGAM2505 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2505 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2505 are further described hereinbelow with reference to Table 1.

[84745] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2505 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2505 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[84746] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2505 gene, herein designated VGAM is inhibition of expression of VGAM2505 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2505 correlate with, and may be deduced from, the identity of the target genes which VGAM2505 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[84747] Adrenergic, Beta, Receptor Kinase 1 (ADRBK1, Accession NM_001619) is a VGAM2505 host target gene. ADRBK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADRBK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRBK1 BINDING SITE, designated SEQ ID:7329, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84748] A function of VGAM2505 is therefore inhibition of Adrenergic, Beta, Receptor Kinase 1 (ADRBK1, Accession NM_001619), a gene which regulates desensitization of b-adrenergic receptors and related GPCRs. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRBK1. The function of ADRBK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM626.Ras Homolog Gene Family, Member C (ARHC, Accession NM_005167) is another VGAM2505 host target gene. ARHC BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARHC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHC BINDING SITE, designated SEQ ID:11662, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84749] Another function of VGAM2505 is therefore inhibition of Ras Homolog Gene Family, Member C (ARHC, Accession NM_005167), a gene which remodels of the actin cy-

toskeleton during cell morphogenesis and motility. Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHC. The function of ARHC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885.ATPase, Na+/K+ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702) is another VGAM2505 host target gene. ATP1A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1A2 BINDING SITE, designated SEQ ID:6364, to the nucleotide sequence of VGAM2505 RNA, herein designated VGAM RNA, also designated SEQ ID:5216.

[84750] Another function of VGAM2505 is therefore inhibition of ATPase, Na+/K+ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702). Accordingly, utilities of VGAM2505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with
